8. Project Description, Justification and Scope

LAWRENCE LIVERMORE NATIONAL LABORATORY (LLNL)

Remedial Action activities involve the environmental investigation and remediation of contaminants in the subsurface at two Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) National Priorities List sites. At the LLNL Livermore Site, there are organic solvents dissolved in ground water at concentrations as high as 10 ppm. In addition, there is one monitoring well on-site with tritium concentrations above the drinking water standard. The entire plume of contaminated ground water at the Livermore Site covers approximately 1 1/4 square miles. The total amount of contaminants is less than 500 gallons. There is also a fuel hydrocarbon leak from an old underground storage tank that released an estimated 20,000 gallons of gasoline. The ground water will be remediated by pumping and treating all of the water within the area of the contaminated plume such that no contaminants will be allowed to pass through the area of the plume without being drawn into one of the extraction wells. The extracted ground water will then be treated at one of seven treatment facilities (currently constructed or planned) and the treated water discharged to surface drainage, reinjected into the aquifer to facilitate cleanup, and/or used for LLNL landscape irrigation or in LLNL cooling towers. Pipelines will be installed to route water from specific areas on- and off-site to reduce plume migration. Livermore site remedial actions also include document preparation; community relations; compliance monitoring; geologic analysis, treatment facility design, construction and operation; source investigations; and well field emplacement.

At LLNL Site 300, there are several small plumes of organic solvents and one plume of tritium in the ground water. The ground water with the tritium plume is moving slowly and modeling indicates that it will be below the safe drinking water levels before the ground water reaches the border of the site. However, due to the California Porter Cologne Act which prohibits the non-degradation of state waters, actions are required to prevent any further migration of contamination. In the area around Building 834, a plume of trichloroethylene (TCE) is present at very high concentrations, but it is confined to a perched aquifer. The site will be remediated to ensure that the TCE does not migrate to the regional aquifer. At the southern part of the site in the General Services Area (GSA), there are three plumes of low-level organic solvents that have migrated off-site. These plumes will be contained (with a decision to use applicable innovative technologies as the remedial action prior to the final Record of Decision (ROD)) by pump and treat technology through interim treatment facilities that are and will be constructed on-site until a final remediation strategy is developed.

- Site 300 Remedial Investigation (RI) includes monitoring activities at portions of the site that do not appear to pose a threat to human health and the environment. Miscellaneous Areas to be monitored include Building 801/Pit 8, 802, 833, 845/Pit 9, 851, Pit 1, Pit 2, and Building 865 (ATA) areas. Monitoring is required by CERCLA and will continue at least until issuance of a site-wide ROD.
- The Burn Pit Closure is a Resource Conservation and Recovery Act (RCRA) closure, to be completed in the FY 1998 to FY 1999 timeframe, and inspection activities associated with the caps on the High Explosive Burn Pit and Pits 1 and 7 will continue through FY 2001.
- Assessment and cleanup activities are ongoing in the GSA/Operable Unit (OU) 1 at Site 300. Two CERCLA Removal Actions are in progress which involves ground water extraction and treatment by air sparging. Soil vapor extraction is also planned as a remedial action. A final ROD as a this OU will be approved in early FY 1997.

2171

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

- Assessment and interim cleanup activities are underway at the Building 834 area OU 2 at Site 300. The cleanup proposals/technologies will address the spectrum of relevant cleanup/containment strategies, ranging from no further action to total cleanup as mandated by CERCLA. This site is located over a perched aquifer which makes this site ideal for testing new and innovative ideas. To accelerate the cleanup, pilot testing of the ground water/soil vapor extraction and treatment systems began in FY 1994 as a CERCLA Removal Action.
- Assessment activities are being finalized and cleanup activities will include capping the Pit 6 Landfill OU 3 at Site 300. Site characterization work was completed during FY 1993. A draft final Feasibility Study (FS) has been completed for this OU3, a final FS was completed in FY 1995, with a final ROD expected in FY 1997. The cupping of Pit 6 is anticipated as a CERCLA removal action to be completed in FY97.
- At the High Explosive Process Area OU 4 at Site 300, a removal action to remove approximately 25 drums will be completed in FY 1998.
- Assessment and cleanup activities are continuing in the Building 850/Pits 3 and 5 Area (includes assessment of uranium and polychlorinated biphenyls) and remedial investigation and potential cleanup activities at the Building 854 Complex, Building 812, and Sandia test area. East and West Firing Areas will continue to be monitored.
- Some of the activities at all OUs will be moved to a site-wide monitoring OU once a no further remedial action has been determined.

Program Management - This sub-project covers site management and support management for the Environmental Restoration Program at LLNL.

GENERAL ATOMICS (GA) - HOT CELL FACILITY:

This project is for the decontamination and dismantlement (D&D) of the Hot Cell Facility and removal of DOE-owned irradiated and material from GA to a DOE storage facility. GA is privately owned and located in LaJolla, California. The facility was utilized for past DOE contracted operations. The DOE project is for that portion (76%) of the total D&D that is related to DOE use of the facility. The owner will provide services and/or funding in proportion to the facility's use (24%) for commercial purposes. Program management activities include integration of all activities required to plan, execute, and manage the program in accordance with DOE, State and local requirements. The primary objective is to prevent contamination from migrating to the environment with related potential adverse effects on the surrounding population. The project is also required by the terms of the owners Nuclear Regulatory Commission (NRC) license and related decommissioning plan and DOE contractual obligation. Rapidly expanding commercial development of areas immediately adjacent to the site will also present the likely probability of significant public attention should the project not be completed in a timely manner.

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

GENERAL ELECTRIC (GE):

This project involves the decontamination of an Alpha Hot Cell (in Building 102) (for continued use) and the decontamination, dismantlement and disposal of a Glove Box (in Building 103) all privately owned by GE, located in Vallecitos, California. Construction type activities at the facility include decontamination to remove alpha contamination in accordance with the requirements of the site NRC license. The scope of the DOE project will be in proportion to the relative proportion of DOE contract work relative to GE commercial work performed in the facility. This summary subproject includes overall management and integration of Environmental Restoration activities. Activities include planning, project control and administration, and management oversight.

LABORATORY FOR ENERGY-RELATED HEALTH RESEARCH (LEHR):

Primary project justification is the removal and prevention of contamination migration to the environment with related potential adverse effects on the surrounding population. The project also prevents non-compliance with Federal and State regulations and a CERCLA Federal Facilities Agreement which could result in significant fines, as well as adverse community, media and Congressional reactions.

Remedial action at LEHR includes assessment and remediation of soil and ground water (by others). Activities include characterizing the soil, including an underground tank system, and ground water to determine the nature and extent of contamination, and to conducting a site-wide Feasibility Study. A ROD, a remedial action plan, and remedial design for remediation of DOE contaminated areas will be prepared as required. DOE is responsible for the disposal of any contaminated waste generated from environmental restoration work.

The technical scope includes data transmittal of quarterly ground water and surface water monitoring reports, Implementation of RI/FS workplan, annual ground and surface water monitoring report, annual site environmental monitoring report, air emissions (NESHAP) annual report. Associated program management activities (e.g. contract management, regulatory and public interface, development of DOE required plans, and reports, project plan, baseline, etc, and oversight of subcontractor activities) are included in support of this subproject.

Technical scope of the D&D activities in this subproject include removal of Dog Pens from landfill Unit #2 for unrestricted use by the University of California at Davis. Activities include demolition of Dog Pens, waste minimization, off-site disposal of waste, and final surveys. Activities performed also include preparation of statement of work for contractors; negotiation of subcontracts; preparation of funding documents; plans and reports; and providing health and safety, waste management, environmental compliance, and Quality Assurance oversight for all activities.

2173

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

SANTA SUSANA FIELD LABORATORY (SSFL)

D&D - Plans are to D&D the Rockwell International Hot Lab (Building 020), located at the SSFL in Simi Valley, Ventura County, California. Operations of the Hot Lab Facility were in support of DOE contracts related to DOE Defense Program activities. Responsibility for D&D of the facility has been accepted by the DOE Surplus Facilities Management Program and transferred to the DOE/Office of Environmental Management. Since the operation of the facility was in support of DOE/Defense Programs, the wastes resulting from operations will be disposed of at the Nevada Test Site. Decontamination requirements are dictated by the NRC license held by the facility operator and the operating contract between DOE and Rockwell International. The Hot Lab consists of four large interconnected hot cells and decontamination rooms, an operating gallery, and associated electrical and pump rooms. In addition to decontamination of the structure, this sub-project includes complete decontamination of asphalt, concrete pads, and the surrounding yard. Construction activities, as related to contractual requirements, dictate that the facility be decontaminated to "unrestricted use". Demolition of the facility will be required due to the extent of structural dismantlement.

ENERGY TECHNOLOGY ENGINEERING CENTER (ETEC)

The scope of work involves the removal and disposal of all radioactive and hazardous wastes, the remediation of adjacent soils and connected support facilities, and the demolition and restoration of the facility site.

Remedial action activities include Area IV characterization and media monitoring, SSFL ground water assessments, SSFL ground water cleanup and remediation of Solid Waste Management Units and areas of concern identified in the Environmental Protection Agency's RCRA Facility Assessment. Soil and ground water contamination studies will continue to determine the extent and nature of contamination from former DOE operations on the site. Scope of soil and ground water is separated into the assessment and remediation phases. Field investigation includes installation of monitoring wells, collection of air, water, and soil samples, soil and gas surveys, and geologic and geophysical studies. The remediation phase will be developed after appropriate inquiry has been completed, and may include testing of new technologies. Program management activities to support assessment and remediation include those required to plan, execute, and manage the Environmental Restoration Program to maintain compliance with Federal, State, DOE, and local requirements.

D&D activities at this site consists of the decontamination for unrestricted use and environmental restoration of DOE-owned facilities located in Area IV of the SSFL in Ventura County, California. Formerly utilized DOE facilities containing radioactive and hazardous contamination must be decontaminated for eventual release of the facility to the land lessor for unrestricted use. The Radioactive Material Disposal Facility (RMDF) Complex is the last remaining radiological facility to be decontaminated and presents the most significant potential hazard for release of radiological contaminants. D&D projects completed require final survey and close-out. The final radiological project is D&D of the RMDF. Activities performed include preparation of statement of work for contractors, negotiation of subcontracts, preparation of funding documents, plans and reports, and providing health and safety, waste management, environmental compliance, and quality assurance oversight for all activities.

2174

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The remedial action and D&D activities are required at ETEC to remove the contamination from past practices and to remediate contaminated surplus facilities. If these activities are not performed, the possibility exists for migration of radioactive and/or hazardous materials to the environment. In addition, non-compliance with Federal and State orders would result in fines and adverse public, media, and Congressional attention. Regulatory drivers include DOE Order 5820.2A, National Pollutant Discharge Elimination System Permit No. CA0001309, 40 CFR 264.90, State of California Toxic Pits Closure Act.

STANFORD LINEAR ACCELERATOR CENTER (SLAC):

The Environmental Restoration Program encompasses the efforts required to characterize and remediate the soils and ground water brought about by DOE-contracted activities at SLAC, a 426-acre site owned by Stanford University and leased to DOE. Current restoration activities are centered on numerous polychlorinated biphenyl-contaminated soil sites and four instances of solvent-contaminated ground water. Soil and ground water is the only technical subproject affiliated with this project.

Primary project justification is the prevention of contamination migration to the environment with related potential adverse effects on the surrounding community. The project also averts non-compliance with Federal and State regulations which could result in significant fines as well as adverse public reactions. Primary regulatory drivers include the Toxic Substances Control Act and a Regional Water Quality Control Order requiring characterization and remediation of ground water contamination, as well as DOE Orders 5400.1 and 5400.4.

LAWRENCE BERKELEY NATIONAL LABORATORY (LBNL):

LBNL consists of a 130-acre facility operated by the University of California for DOE on land owned by the University. Remedial action activities at LBNL consist of the characterization and remediation of heavy metals and solvent-contaminated soil and ground water and the RCRA closure of an existing Hazardous Waste Handling Facility (HWHF). Environmental Restoration activities at LBNL will be conducted under the purview of RCRA Correction Action requirements associated with the permitting of a new HWHF. Scope of soil and ground water is separated into the assessment and remediation phases. Assessment includes a RCRA Facility Assessment, RCRA Facility Investigation, and a Corrective Measures Study. Field investigation includes installation of monitoring wells, collection of air, water, and soil samples, soil and gas surveys, and geologic and geophysical studies. The remediation phase will be developed after appropriate inquiry has been completed, and may include testing of new technologies. Site characterization and remediation activities are required to satisfy a RCRA Part B Permit. A RCRA Part B Permit is required in order for LBNL to start operation of a new HWHF.

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The HWHF Closure Plan required by the RCRA Part B permit is designed to ensure that the facility will not require further maintenance, eliminates threats to human health and the environment, and precludes escape of hazardous wastes or contaminants. Planning for the construction of a new HWHF is under way. The purpose of the new facility is to bring LBNL into compliance with applicable laws and regulations regarding the storage and disposal of hazardous, mixed, and radioactive wastes generated by LBNL program activities. The closure of the existing HWHF at LBNL is required under the RCRA Part B permit issued by the State of California, Department of Toxic Substances Control.

PROGRAM MANAGEMENT:

Program management is the administrative function that supports all Environmental Restoration projects. Major program management activities include administration, project controls, and technical support. Administrative responsibilities include maintaining a liaison with DOE and coordinating activities. Project control responsibilities include preparation of programmatic documents, etc. Technical support includes a technical advisory board which provides overall technical guidance.

CONTRACTOR SUPPORT/STATE GRANTS:

The purpose of contractual services is to support the field office's environmental restoration functions, which are regulated by a consortium of Federal and State regulatory agencies to ensure DOE's adherence to environmental laws and regulations. These functions include program management guidance, direction and appraisal of the overall environmental restoration activities of assigned contractors and laboratories, coordination with other Oakland organizations, and functions to assure proper utilization of resources, and liaison between top DOE management and DOE/Headquarters and top management of regulatory agencies and the laboratories. The purpose of State Grants is to allow active involvement by representatives of the appropriate State agencies to ensure compliance with applicable State and local laws and regulations. Without a provision for reimbursement of State oversight activities, the State would almost certainly issue one or multiple enforcement order(s) against DOE which would require resolution through costly legal proceedings.

Contractor Support - Environmental/management consultants support the environmental restoration efforts in areas of specialized expertise. This expertise is not available nor needed on a full-time basis. Activities include performing cost validations, developing database systems, providing technical evaluations, and performing sampling and analysis testing. Technical expertise includes, but is not confined to, areas of specialized knowledge such as toxicology, chemistry, environmental specialty and/or engineering, and the life and earth sciences areas. Other areas of expertise include experience and/or certification to perform tests and measurements. On-site activities include sampling and analysis, testing of equipment, and inspection of on-site conditions to validate elements of the environmental management program. Off-site (office) activities include drafting documents, verifying calculations, performing data processing, and site specific plan processing.

2176

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

State Grants - Participation and concurrence by State regulatory agencies is mandatory in order to successfully conclude the RCRA and CERCLA programs at all DOE/Oakland (DOE/OAK) sites and allow DOE to fulfill its legal obligation. Grants have been awarded to the State of California's Department of Toxic substances Control and Water Quality Management Board for LLNL, LEHR, LBNL, and SLAC.

9. Method of Performance

LLNL: All work on the project will be conducted by the University of California under a Management and Operating (M&O) contract with the DOE with appropriate subcontracts, as necessary, for such things as hydrogeological services, drilling, and construction activities.

GA and GE: GA and GE contract strategy has been changed making GA and GE sole-source contractors. Oversight of project completion objectives will be provided by DOE/HQ and Field Office.

LEHR: Program management and site health and safety assurance are being provided by the Richland M&O Pacific Northwest Laboratory (PNL). Specific Project tasks will be contracted by PNL according to DOE contracting requirements. Independent oversight of project completion objectives will be provided by an independent contractor procured by DOE/HQ.

SSFL: Rockwell, Rocketdyne Division, has been contracted with by DOE/OAK to perform the D&D and demolition of the facility. Contractor activities are overseen by DOE/OAK/EM and the NRC. Independent verification of final release of the facility will be made by Oak Ridge Institute for Science and Education under a contract with both DOE and NRC. The performance schedule of this project is driven by the requirements of the NRC license, by contract between DOE and Rockwell International, as well as the highly-visible nature of the facility. Strong public, media, and Congressional attention has been received by this project.

ETEC: Rocketdyne Division of Rockwell International, through an existing management and operating (M&O) contract with DOE, will provide the primary oversight of the project and significant portions of the project labor. Additional labor will be subcontracted in accordance with DOE contracting regulations. Independent oversight of project completion objectives will be provided by an independent contractor procured by DOE/HQ.

SLAC: Identification, evaluation, and prioritization of remedial action sites will be accomplished under the management and operating contract with Stanford University. Site characterization, sampling, and document preparation will be supported by environmental subcontractors. Chemical analysis will be performed by Environmental Protection Agency (EPA) certified laboratories. Engineering, design and implementation of selected remedies will be furnished by contractors. All contractors and laboratories will be chosen by competitive bidding and fixed price contracts in accordance with DOE regulations for selection and award.

2177

1. Title and location of project:	Oakland Environmental Restoration Project	2a. Project No. D/ND-1.4.8
	Various Locations	2b. Operating Expense Funded

9. Method of Performance (continued)

LBNL: Identification, evaluation, and prioritization of remedial action sites will be accomplished under the M&O contract with the University of California. Site characterization, sampling, and document preparation will be supported by environmental subcontractors. Chemical analysis will be performed by EPA certified laboratories. Engineering, design and implementation of selected remedies will be furnished by contractors. All contractors and laboratories will be chosen by competitive bidding and fixed prices contracts in accordance with DOE regulations for selection and award.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 158,260	$ 35,753	$ 34,735	$ 33,190	$ 112,454	$ 374,392
2. Decontamination & Dismantlement	50,185	3,536	8,714	7,522	32,411	102,368
3. Long-term S&M	0	0	0	0	0	0
4. Landlord	0	0	0	0	0	0
5. Compliance Oversight	825	325	200	394	1,420	3,164
b. Contingency	0	0	0	0	0	0
Total	$ 209,270	$ 39,614	$ 43,649	$ 41,106	$ 146,285	$ 479,924

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

8. Project Description, Justification and Scope

The Environmental Restoration (ER)/Defense Major Systems Acquisition (MSA) is the aggregation of those activities required for the Department of Energy to satisfy its goal of a 30-year remediation of contaminated sites at all of the facilities and areas under its cognizance. This includes those activities necessary to plan, budget, and manage all work necessary to meet the goal. Remedial Action (RA) and Decontamination and Dismantlement (D&D) activities are conducted in accordance with State and Federal regulatory requirements and are often governed by chosen plans, consent decrees, and/or Federal Facility Agreements (FFAs), and/or Federal Facility Compliance Agreements.

Oak Ridge Operations Office (ORO):

The facilities managed by Lockheed Martin Energy Systems, Inc., at the DOE ORO where the ER activities are partially funded by the Defense funds are: the Y-12 Plant (fully defense funded), the Oak Ridge National Laboratory (ORNL), the K-25 Plant, and other Oak Ridge Reservation (ORR) sites. In addition, other areas not on the ORR are included. Activities at other areas in Oak Ridge but not on the Reservation and the activities required to manage the MSA are funded by the ORO-MSA defense appropriation.

RA:
RA activities include Remedial Investigations/Feasibility Studies (RI/FS) of contaminated sites, Resource Conservation and Recovery Act (RCRA) facilities assessments, interim corrective measures, remedial design and construction, and independent verification of the remedial activities.

D&D:
Activities include the D&D of surplus facilities and equipment contaminated by various chemical and radioactive wastes. Pending the final disposition of the D&D facilities, the goal of this activity is to initially place the D&D facilities in a state where they are harmless to the general public or, if the units cannot be acceptably decontaminated, to isolate and contain the units in order that the general public is not exposed to them. Surveillance and maintenance (S&M) of facilities are also considered a part of this program.

Y-12 Plant:

RA:
The Y-12 Plant occupies an 811 acre site in the Bear Creek Valley about 2 miles from downtown Oak Ridge, Tennessee. The site is drained by Bear Creek and the East Fork Poplar Creek (EFPC). The operable units are grouped within three hydrogeological regimes: (1) Bear Creek Valley, located west of S-3 Ponds; (2) Upper EFPC, located east of S-3 Ponds through Y-12 Plant to the outfall of Lake Reality, and (3) Chestnut Ridge. The Y-12 Plant contains many facilities that have been used for treating, storing, or disposing of hazardous and radioactive materials and wastes.

2181

1. Title and location of project:	Oak Ridge Operations Office	2a. Project No. D/ND-1.4.12
	Oak Ridge, Tennessee	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

D&D:
The Y-12 Plant D&D Program includes facilities which have been identified as having no further mission in the Defense Program and have been transferred to Environmental Restoration. Currently, Building 9201-4 is the only Y-12 facility that has been accepted into the Program. The 9201-4 project's initial phase includes planning and assessment activities consisting of surveillance and maintenance, asbestos removal, and Pre-Phase I assessment evaluation, safety analysis, and risk analysis. D&D of Building 9201-4 will eventually result in a gutted building.

Program Management Support:
This is a separate Summary Subproject for the Program Management activities that support more than one remedial action subproject at the Y-12 Plant.

ORNL:

ORNL RA:
The ORNL ER Program addresses the remediation of environmental contamination resulting primarily from past waste management practices. Past research and development and waste management activities at ORNL have produced a significant number of surplus, inactive facilities contaminated with low-level radioactive and/or hazardous chemical wastes. Such sites include solid waste storage areas, waste ponds and seepage pits, radioactive waste processing and transfer facilities, research laboratories, dedicated environmental research areas, experimental reactors, radioisotope development facilities, and the areas surrounding these sites. A wide variety of liquid and solid wastes, primarily radioactive or mixed wastes, have been disposed of on-site; 300 contaminated sites have been identified on the 2,900 acre ORNL area. Because of the large number of sites to be considered and the hydrogeological complexity of the ORNL area, the remedial action strategy is oriented toward waste area groupings (WAGs). The ORNL sites have been placed within 20 such groupings, 13 of which are scheduled for detailed investigation and characterization, defined by watersheds that contain contiguous and similar remedial action sites, each representing distinct small drainage areas within which similar contaminants were introduced. Activities include RI/FS of contaminated sites, RCRA facilities assessments, interim corrective measures, remedial design and construction, and independent verification of the remedial activities.

Oak Ridge Associated Universities (ORAU):

Due to former activities at the ORAU facilities (Freels Bend Area and the South Campus) areas were contaminated. The RI/FS and RA at these sites are funded in this MSA.

2182

1. Title and location of project:	Oak Ridge Operations Office Oak Ridge, Tennessee	2a. Project No. D/ND-1.4.12 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

ORR:

Clinch River/Watts Bar:
The Clinch River/Watts Bar RI is a multiple-facility (Y-12, ORNL, K-25) and reservation-wide task that addresses the transport of water-borne contaminants beyond the boundary of the DOE ORR; the contamination of water, sediment, and biota in off-site surface-water environments; and the risks to human health and the environment associated with off-site contamination. This activity includes investigation of the nature and extent of contamination, identification and evaluation of remediation alternatives, implementation of selected remedial actions, and any interim measures determined to be necessary to protect human health and the environment.

Primary areas of investigation include Melton Hill Reservoir, the Clinch River from Melton Hill Dam to its confluence with the Tennessee River, the White Oak Creek Embayment, and the Poplar Creek Reservoir. The system is large, encompassing 140 river miles in length and 44,000 acres in surface area, and is used for municipal water supply, sport fishing, boating, swimming, tourism, and residential development. Contaminants of concern include metals (primarily Mercury, Lead, Arsenic, Selenium, and Chromium), organic compounds (primarily polychlorinated biphenyls, dioxin, and chlordane), and radionuclides (primarily Cesium-137, Cobalt-60, Hydrogen-3, and Strontium-90).

Non-FFA Sites:

There are several sites not on the Oak Ridge Reservation that were contaminated due to the operations at the DOE Facilities. The cleanup of those sites is included in this Summary Subproject. They include the Atomic City Auto Parts Site, David Witherspoon Site, and the CSX Transportation Site.

Lower EFPC:

EFPC originates as an on-site surface water drainage system at the Y-12 Plant. During plant operation, EFPC has received various treated and untreated discharges from building drains as well as non-contact process cooling waters and site runoff. As a result, the EFPC and its floodplain have become contaminated with materials such as mercury, uranium, thorium, chromium, and zinc. The Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) process for EFPC has begun, starting at Outfall of Lake Reality as EFPC exits the Y-12 plant.

1. Title and location of project:	Oak Ridge Operations Office Oak Ridge, Tennessee	2a. Project No. D/ND-1.4.12 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

K-25 Site:

D&D:
There are eighty-two facilities at the K-25 Plant that require S&M and eventual D&D; thirteen former Centrifuge facilities and sixty-nine gaseous diffusion process facilities, including the five main process buildings.

Landlord:
The purpose of these activities is to achieve and/or maintain a site infrastructure which can best support critical DOE Programs located at the K-25 Plant. This goal will be achieved by the procurement of capital equipment, the construction of new facilities when required, and improving existing facilities through electrical upgrades, asbestos abatements, and similar type projects.

Program Management Support:
Activities that support the K-25 Site ER Program as a whole and cannot be associated with any particular Summary Subproject are funded in Program Management Support. These include the site wide reporting, baselines, technical integration, and senior management of the DOE Prime Contractors. Also included are special projects that require funding but do not fall within any of the Summary Subprojects, such as historical investigations and preliminary assessments/site investigations.

ER Waste Management Treatment/Storage/Disposal (TSD):
Activities are necessary to provide capacity for ER waste generation. These activities include funding for commercial TSD activities. Lockheed Martin Energy Systems (LMES) support functions include program management, training, systems and planning, and waste minimization. These activities include all waste streams (including D&D wastes) that cannot be treated or disposed of within the areas of contamination at all sites. The ER waste management technical scope also involves TSD facilities/activities to provide capacity for ER waste generation which has been left untreated in storage or cannot be provided final disposition during remediation.

Construction Type Facilities:
This program is required to construct certain facilities/systems to carry out its mission. The following are those subprojects that are not remediation-related but are still necessary to perform the program mission.

2184

1. Title and location of project:	Oak Ridge Operations Office	2a. Project No. D/ND-1.4.12
	Oak Ridge, Tennessee	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Process modifications will be made to the existing Central Pollution Control Facility. The modifications will utilize existing equipment and add new equipment as required to meet National Pollutant Discharge Elimination System permit requirements for mercury discharges.

The Y-12 Containerized Waste Storage Facility, the Mercury Roaster Pilot Facility, the RCRA Storage Building, the Y-12 Class IV Landfill, and the Y-12 Mercury Roaster have been deleted from the FY 1994-2000 timeframe.

ORNL:

The ORNL ER Program addresses the cleanup of environmental contamination resulting primarily from past waste management practices. Past research and development and waste management activities at ORNL have produced a significant number of surplus, inactive facilities contaminated with low-level radioactive and/or hazardous chemical wastes. Such sites include solid waste storage areas, waste ponds and seepage pits, radioactive waste processing and transfer facilities, research laboratories, dedicated environmental research areas, experimental reactors, radioisotope development facilities, and the areas surrounding these sites. A wide variety of liquid and solid wastes, primarily radioactive or mixed wastes, have been disposed of on-site; 300 contaminated sites have been identified on the 2,900 acre ORNL area.

RA:
Activities include RI/FS of contaminated sites, RCRA facilities assessments, interim corrective measures, remedial design and construction and independent verification of the remedial activities.

The Office Trailers project at ORNL is under $1.2M and not included in the above RA descriptions.

Because of the large number of sites to be considered and the hydrogeological complexity of the ORNL area, the remedial action strategy is oriented toward WAGs. The ORNL sites have been placed within 20 such groupings, defined by watersheds that contain contiguous and similar remedial action sites, each representing distinct small drainage areas within which similar contaminants were introduced.

2185

1. Title and location of project:	Oak Ridge Operations Office	2a. Project No. D/ND-1.4.12
	Oak Ridge, Tennessee	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

D&D:
Activities include the D&D of surplus facilities and equipment contaminated by various chemical and radioactive wastes. Pending the final disposition of the D&D facilities, the goal of this activity is to place the D&D facilities in a state where they are harmless to the general public or, if the units cannot be acceptably decontaminated, to isolate and contain the units in order that the general public is not exposed to them. S&M of facilities are also considered a part of this program.

Project Management Support:
This is a separate Summary Subproject for the Program Management activities that support more than one remedial action subproject at ORNL.

Construction Type Facilities:
This program is required to construct certain facilities/systems to carry out its mission. The following are those subprojects that are not remediation related but are still necessary to perform the program mission.

The following ORNL projects reflect the most recent in-depth review of approved construction projects. Projects shown in prior Construction Project Data Sheets should not have been classified as construction-type activities.

Process Waste Surge Tank:
Scope consists of a surge tank to be built to replace the 3524 equalization basin and the 190 basins at ORNL to provide surge capacity for the Process Waste Treatment System during periods of heavy rainfall. This project will support a required CERCLA remediation activity to close the surface impoundments in WAG 1 scheduled to be operational in early 1996.

ORNL WAG 4 Seeps:
The WAG 4 Seeps Project is intended to reduce the off-site risk to human health and the environment from ^{90}Sr seeping from buried waste in WAG 4. Estimates derived from sampling events indicate that 22 percent of all ^{90}Sr discharging from ORNL originates at WAG 4. Investigations are under way to select the best remedial strategy. The ROD is due August 1996. A likely scenario is to hydrologically isolate the trenches and other areas suspected of contributing to the ^{90}Sr flux and installing multi-layer caps.

2186

1. Title and location of project:	Oak Ridge Operations Office Oak Ridge, Tennessee	2a. Project No. D/ND-1.4.12 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

ORNL WAG 5 Seeps:
The WAG 5 Seeps Removal Project is intended to remove greater than 90 percent of the ^{90}Sr from water collected at Seeps C and D. Construction of the two collection and treatment units was completed in November 1994 and operation was initiated in FY 1995. Seeps monitoring will continue in FY 1996.

ORNL In-Situ Vitrification Demonstration Pit 1:
The In-Situ Vitrification (ISV) technology demonstration at Pit 1 is intended to demonstrate the effectiveness of the vitrification process in a full-scale test. Also, this will establish the implementability of the ISV technique for the radioactive contaminated soil.

The purpose of the ER Program is to remediate, decontaminate, and decommission those DOE sites/facilities in compliance with applicable local, State, and Federal regulations within the DOE's 30-year timetable for completion. Legal requirements include those of the Atomic Energy Act, other Federal and State statutes and regulations, and DOE Orders, as well as the consent decrees, court orders, and agreements relevant to the ORR. The primary Federal regulations that drive the ER are CERCLA, as amended by the Superfund Amendments and Reauthorization Act of 1986 (the ORR is on the Environmental Protection Agency's National Priorities List), and RCRA.

9. Method of Performance

RA: RIs will be performed by MMES personnel and subcontractors to LMES. Preparation of FSs, RA Plans, Records of Decisions, National Environmental Policy Act (NEPA) documentation, RA design and construction will be performed by DOE prime technical support contractors. LMES is the integrating contractor.

D&D: Planning, preparation of FSs and NEPA documentation will be performed primarily by subcontractors to MMES. S&M activities consist of multidisciplinary efforts coordinated by LMES and its subcontractors. These activities include periodic site inspections, maintenance of physical structures and containment system, and radiological surveillance. Construction and procurement will be accomplished utilizing fixed-price subcontract awarded on the basis of competitive bidding, where it is in the best interest of the Government.

2187

1. Title and location of project: Oak Ridge Operations Office

	FY 2005	244,399	0	244,399	244,399

[a]The previous cost estimates for the TPC only reflect costs for the period FY 1996-2001. This accelerated case will complete remediation (except for ground water) in 10 years instead of 25 years which will result in estimated savings of $1.4 billion (expressed in constant 1996 dollars).

[b]Current cost estimate reflects appropriated dollars and FY 1996-2005 estimates.

1. Title and location of project:	Fernald Environmental Management Project (FEMP) Fernald, Ohio	2a. Project No. D-1.4.15 2b. Operating Expense Funded

8. Project Description, Justification and Scope

The project scope includes Environmental Restoration, Waste Management, Landlord, Decontamination and Dismantlement (D&D), as well as all construction activities that were previously separate line items or General Plant Projects (GPP). In FY 1992, the FEMP Major System Acquisition (MSA) scope was revised to include all site activities, with the exception of EM-50 Technology Development and Defense Programs Materials Disposition. This project includes the remediation activities at the FEMP from the start of the remedial investigation/feasibility study (RI/FS) through the completion of the full remediation of the site in FY 2005 based on the $276 million 10-year accelerated case.

The purpose of the project is to remediate the 1,050 acre FEMP site, while ensuring protection of the public health, worker health and safety, and the environment. The site is divided into five operable units (OUs), each of which will have its own Record of Decision (ROD). The remedial design/remedial action phase of this project was started in FY 1989 with initiation of the Conceptual Design Report for Waste Pit 5 of OU1. The details for site remediation will not be determined until the issuance of the RODs.

Waste treatment facilities to include vitrification and decontamination will be constructed in support of the remediation efforts of the FEMP.

The FEMP MSA is consistent with the Environmental Restoration Program Work Breakdown Structure (WBS). The Activity Data Sheets are grouped as summary subprojects consistent with the WBS as follows: Remedial Actions, Landlord, Treatment/Storage/Disposal (TSD) Facilities, and Program Management Support. The subproject level divides the remedial action work into five OUs, which are governed by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) Amended Consent Agreement (CA) between the Department of Energy (DOE) and the United States (US) Environmental Protection Agency (EPA). The TSD Facilities include the waste management activities and Resource Conservation and Recovery Act (RCRA) facility closures. The landlord activities include environmental monitoring and base services. The program management and support activities include litigation activities and regulatory oversight.

Landlord funding will support the following: applicable DOE Order requirements, hazards abatement, safety analysis, environmental monitoring, permitting activities, training, engineering support, landlord facilities, and base program services, and their support. The major direct tasks to be accomplished include: asbestos removal; facilities Occupational Safety and Health Act (OSHA) upgrade; nuclear criticality and system safety programs; air, water, and soil sampling and analysis; continuation of the environmental monitoring program; permitting actions; continued site support of training; and support projects. The landlord facilities base program services include the continuation of basic site services required for daily operations such as utilities and maintenance, site cleanup and housekeeping, and the operational readiness review program.

During FY 1996 construction projects will include boiler house relocation cafeteria up grade (will be used for training purposes) and the ongoing upgrade of the public water supply.

1. Title and location of project:	Fernald Environmental Management Project (FEMP) Fernald, Ohio	2a. Project No. D-1.4.15
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The FEMP MSA includes several projects that had previously been separate projects. The Environmental, Health and Safety Improvements line item which is now recast into the FEMP MSA, provides a series of improvements that will minimize the potential for transfer of radionuclides; and minimize the emission of toxic gases and releases of hazardous wastes to ensure that site activities do not pose a threat to the public and the environment. The Utilities Life Extension Phase I project, the Production and Radiological Improvements, Productivity Retention Program and GPPs are just a few examples of site line item activities that have been recast into the FEMP MSA.

OU1: Waste pits 1-6, clearwell, burnpit, berms, liners and soil within the OU boundary.
OU2: Flyash piles, South Field Disposal Areas, lime sludge ponds, Solid Waste Landfill, berms, liners, and soil within the OU boundary.
OU3: All man-made structures and facilities at the FEMP, above and below ground. (Facilities specifically excluded from OU# are: K-65 Area; Waste Storage Pits; Flyash Piles).
OU4: Silos 1, 2, 3, and 4, berms, decant tank system, soils and any buried concrete beams surrounding Silos 1 and 2, and perched water (encountered during remediation).
OU5: Ground water, surface water, soil not included in the definitions of OUs 1-4, sediments, flora, and fauna.

Final remediation of soils will be accomplished under OU5; all structures under OU3.

The expected cost of the identified construction projects is as follows:

Construction Project	TPC	Prev.	FY 1995	FY 1996	FY 1997	Outyear	Construction Start - Completion Dates
1. Advanced Waste Water Treatment	$53,075	$50,742	$ 1,843	$ 490*	$ 0	0	* Operating in FY 1996
2. South Plume Project	12,784	12,784	0	0	0	0	
3. Sanitary Sewer Upgrade	0	0	0	0	0	0	
4. Utility Life Extension Project	29,172	8,812	20,360	0	0	0	
5. Telecommunications	2,718	318	2,400	4	0	0	
6. Public Water Supply	1,088	257	831	50	0	0	
7. Plant Wide Storm Sewer Improvements	580	580	0	0	0	0	
8. General Site Sump Improvements	1,724	1,591	133	0	0	0	
9. Thorium Overpacking Structure	1,000	1,000	0	0	0	0	
10. Plant 1 Pad	4,885	3,000	1,885	0	0	0	
11. Cafeteria Upgrade	0	0	0	1,185	0	0	
12. Boiler Relocation	0	0	0	4,535	0	0	
Total	$107,026	$79,084	$27,452	$ 6,264	$ 0	$ 0	

2191

1. Title and location of project:	Fernald Environmental Management Project (FEMP) Fernald, Ohio	2a. Project No. D-1.4.15 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The purpose of the FEMP is to successfully complete Environmental Restoration Programs at the Fernald Site. A principal component of the project is the implementation of remedial actions at Fernald consistent with the terms of the Amended CA between the DOE and EPA. In support of this component of the project, the RI/FS which evaluates viable remedial action alternatives to address identified environmental concerns is essentially complete. Specific remedial actions for Fernald will be defined in the RODs resulting from the RI/FS process for each OU. There are signed or approved RODs which document remedy selection for four of the five OUs with the fifth ROD being complete in early FY 1996.

For planning purposes, a remedial action scenario has been assumed, based on the $276 million 10-year accelerated case, involving on-site disposal of waste inventories, resulting in an estimated TPC through FY 2005 of $4,475,686. This TPC also includes the related remediation activities to be accomplished at the site through FY 2005, such as waste management, landlord, D&D, and construction projects. Under the accelerated schedule, all remediation activities will be completed by FY 2005; however, ground water monitoring and pumping will continue after disposal cell completion through FY 2020.

The FEMP MSA was formulated to provide a structured framework for allocating the necessary resources to complete an Environmental Restoration Program at Fernald in accordance with environmental regulatory agreements and decrees and pertinent DOE Orders. Regulatory agreements in place at Fernald include the Federal Facility Compliance Agreement (FFCA), an Amended CA under CERCLA Sections 120 and 106(a) with the US EPA, an Amended Consent Decree with the State of Ohio, and an FFA with the EPA for control and abatement of Radon-222 emissions.

On March 1, 1985, the EPA issued a Notice of Noncompliance to the DOE pertaining to major concerns over potential environmental impacts associated with past, present, and future operations at Fernald. On July 18, 1986, DOE entered into a cooperative agreement with the EPA, known as the FFCA, to ensure compliance with environmental statutes and regulations at Fernald. On November 21, 1989, the Fernald site was placed on the CERCLA National Priorities List (NPL) establishing a statutory framework for the conduct of both the RI/FS and resultant remedial actions. To accommodate the statutory requirements as defined in Section 120 of CERCLA pertaining to NPL-listed Federal facilities, a CA was entered into by the EPA and DOE in July 1990 to establish a formal framework for the completion of the RI/FS process and implementation of removal and remedial actions. The CA superseded the CERCLA section of the 1986 FFCA. On September 20, 1991 an Amended CA was established. On December 19, 1991, the Amended CA became effective, subsequent to the resolution of public comments.

The overall project objectives for the FEMP MSA are to:

1. Effectively implement the requirements of the Amended CA (September 1991) with the US EPA including, but not limited to, completion of the RI/FS process and identified remedial and removal actions.
2. Effectively implement the requirements of the Consent Decree (December 1988) and the Amended Consent Decree (January 1993) with the State of Ohio.

2192

1. Title and location of project:	Fernald Environmental Management Project (FEMP) Fernald, Ohio	2a. Project No. D-1.4.15
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

3. Effectively implement the requirements of the FFA with the EPA for control and abatement of Radon-222 emissions.
4. The implementation of Environmental Restoration Programs consistent with applicable Environmental statutes, regulatory agreements, and DOE Orders.
5. Conduct long-term environmental monitoring and surveillance program at Fernald to ensure protection of human health and the environment, and the continued efficient performance of Environmental Restoration Construction activities.
6. Complete safe shutdown activities at Fernald to place former production facilities into a safe, shutdown condition.
7. Provide base facility support services including health and safety, medical surveillance, emergency response, utilities, maintenance, grounds keeping, security, etc., in support of the efficient and safe implementation of site restoration.
8. The completion of the RI/FS process, removal and remedial actions, and other site operations in a manner consistent with applicable requirements.
9. Supplement the existing technology base pertaining to the environmental restoration to support both the efficient performance of the FEMP activities and benefit restoration efforts at other sites.
10. Record plans, procedures, costs and other data so that knowledge and experience gained during the course of the restoration and D&D efforts at Fernald will be readily available to other individuals engaged in restoration efforts, whether sponsored by federal agencies or the private sector.
11. Risk Reduction - Identify the reductions in risk to human health that will occur as a consequence of cleanup actions at the FEMP and identify the reductions in total radiological activities that accompany the site's environmental restoration and facility D&D efforts.

Near-term actions are carried out consistent with applicable guidance criteria and considerations set forth in CERCLA, RCRA, National Environmental Policy Act (NEPA), State of Ohio regulatory requirements, and DOE Orders. Actions undertaken will meet identified applicable or relevant and appropriate requirements (ARARs) and will contribute to the efficient performance of anticipated final remedial actions.

Remedial actions must fulfill the technical requirements, pertinent DOE Orders and regulatory guidance and considerations set forth in the National Contingency Plan, CERCLA, and NEPA. Specific technical-based remedial action goals include compliance with ARARs, to be considered requirements (TBCs), and risk based cleanup standards. Promulgated State regulations identified to be more stringent than comparable Federal standards must similarly be attained. In the event that pertinent ARARs cannot be identified or are deemed not protective, non-promulgated guidance, policies, or other technical specifications can be adopted as TBCs. In the case where multiple contaminants and exposure pathways exist, risk based remedial goals will be established.

In addition, an evaluation has been made of the risk reduction benefits that are likely to occur as the FEMP's remedial activities proceed forward. The specific objectives of this evaluation are twofold: 1) to identify the step-wise reduction in risk to human health that will occur as a consequence of cleanup action contemplated for the site; and 2) to identify the reduction in total radiological activity that accompany the site's environmental restoration and facility D&D efforts.

2193

1. Title and location of project:	Fernald Environmental Management Project (FEMP) Fernald, Ohio	2a. Project No. D-1.4.15
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Fernald has begun implementation of its cleanup remedies; indeed, construction has begun on a vitrification pilot plant, which will turn radioactive sludges into a glass-like form. CERCLA requires that remedial action begin within 15 months of the date of the RODs are signed, so actual cleanup activities will be underway for the entire site in a matter of months. In addition, 30 short-term removal actions have been completed or are now in progress at Fernald. These actions are designed to eliminate or control contamination sources prior to final cleanup.

9. Method of Performance

Project Management in FY 1992 was performed by a Management and Operating Contractor. In FY 1992, the performance based Contractor (Environmental Restoration Management Contractor (ERMC)) for the FEMP was selected and completed transition for Project Management on December 1, 1992. Under the ERMC, design and inspection will be performed by an architect-engineer. Construction and procurement will be accomplished by the construction manager, integrating contractor's subcontractor, utilizing fixed-price subcontracts to the maximum extent feasible, awarded on the basis of competitive bids.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-05) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 351,620	$ 154,209	$ 196,388	$ 176,942	$ 1,514,166	$ 2,393,325
2. Decontamination & Dismantlement	104,329	14,104	18,520	28,494	348,800	514,247
3. Long-term S&M	0	0	0	0	0	0
4. Landlord	917,584	61,237	42,373	56,364	465,132	1,542,690
5. Compliance Oversight	0	0	0	0	0	0
b. Contingency	0	0	0	0	0	0
Total	$ 1,373,533	$ 229,550	$ 257,281	$ 261,800	$ 2,328,098	$ 4,450,262

NOTE: Landlord category includes: Landlord, Program Management, DOE-FN Costs (8-B1), and ongoing litigation.

2194

1. Title and location of project:	Fernald Environmental Management Project (FEMP) Fernald, Ohio	2a. Project No. D-1.4.15 2b. Operating Expense Funded

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the OSHA of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

2197

1. Title and location of project:	Battelle Columbus Laboratories Decommissioning Project (BCLDP) Columbus, Ohio	2a. Project No. D/ND-1.4.14 2b. Operating Expense Funded

8. Project Description, Justification and Scope

On April 16, 1943, the Battelle Memorial Institute (BMI) entered into Contract No. W-7405-ENG-92 with the Manhattan Engineer District (MED) to perform atomic energy research and development (R&D) activities. Since that time, BMI has continuously performed R&D work at its facilities, under the contract for the MED and its successor agencies (Atomic Energy Commission, Energy Research and Development Administration, DOE). The fifteen buildings (described below), or portions thereof, which became radioactively-contaminated as a result of performance of work under the Government contract, are to be decontaminated and released to BMI under the DOE's Environmental Management Program. The buildings are owned by BMI, and the facility retains an active Nuclear Regulatory Commission (NRC) license for possession of special nuclear material.

The type and extent of contamination varies from facility to facility, being dependent on the nuclear work previously performed. Most of the contamination at the King Avenue site is due to uranium, thorium, and associated daughter products. This also applies to the South Area of the West Jefferson Site. The transuranic, mixed fission products, and activation product contamination are confined to the North Area of the West Jefferson Site.

The BCLDP will decontaminate all buildings and surrounding areas that have been used for Government sponsored nuclear research and return them to the owner, BMI, in a condition suitable for use without radiological restrictions. A total of 15 buildings and surrounding land areas are included in the BCLDP. Nine of the buildings involved in the BCLDP are located in the city of Columbus, Ohio, on the King Avenue campus. This site is bounded by the Ohio State University, a high-density residential area, and a river which passes through the city. Several commercial and industrial areas are within 1/2 mile of the facility. The nuclear research, which was performed in the nine buildings, included processing and machining of enriched, natural, and depleted uranium and thorium, fuel element fabrication, radiochemical analyses, and powder metallurgy studies.

The remaining six buildings involved in the BCLDP are located at the West Jefferson research site. This rural site, located in West Jefferson, Ohio, is about 17 miles west of Columbus. The West Jefferson Site occupies approximately 1,100 acres and includes three areas: (1) the Engineering Area in the southeastern portion, (2) the Experimental Ecology Area in the eastern-central portion, and (3) the Nuclear Sciences Area in the northern portion.

The estimated remaining square footage to be decontaminated totals approximately 546,000 square feet: 41,000 square feet at King Avenue campus and 505,000 square feet at the West Jefferson campus. The total encompasses over 400 rooms/areas at the two campuses.

2198

1. Title and location of project:	Battelle Columbus Laboratories Decommissioning Project (BCLDP) Columbus, Ohio	2a. Project No. D/ND-1.4.14
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Decontamination and Decommissioning (D&D):

The effort involves the ongoing D&D of 9 remaining of 15 total BMI buildings, or parts thereof, and soil areas containing radioactive contamination from Federal programs that were conducted at BMI facilities in Columbus and West Jefferson, Ohio. Effort includes planning and direct oversight of D&D operations, removal of contaminated items from identified laboratory and work areas, characterization of support areas, removal of loose and fixed radioactive contamination from interior building surfaces, excavation and removal of contaminated drains and soils, transfer of contaminated materials to the waste processing area(s). Effort also provides for radiological surveillance and control of contaminated areas during active D&D. As D&D is completed in each building, verification surveys will be conducted, and the building will be released to BMI for use without radiological restrictions. It also provides for restoration payments to be made as settlement to BMI, a private owner, to return the facilities for use without any radiological restrictions.

Program Management:

Provides for overall support project management of the BCLDP decontamination effort (a Major Project) in compliance with the requirements of DOE Orders 1332.1A and 4700.1 and DOE Notice 4700.5. This covers planning and reporting related to permitting regulatory and environmental compliance, implementation of Defense Nuclear Facilities Safety Board 90-2 requirements and order/code compliance, and outreach efforts under the project public participation plan.

DOE has accepted responsibility for the cost of decontaminating the facilities as part of the termination of Contract W-7405-ENG-92. As part of the agreement, BMI will contribute 10% towards the TPC. In order to terminate part of its NRC license, BMI will also demonstrate compliance with NRC requirements for facility D&D.

The overall project objective is to decontaminate and dismantle the BMI facilities in a safe, technically sound, and cost effective manner, returning these facilities to the owner (BMI) in a condition suitable for use without radiological restrictions per limits defined in NRC Reg. Guide 1.86, and in keeping with the principles of As Low As Reasonably Achievable. This project will fulfill the requirements of the Mission Need Statement by accomplishing the following objectives:

1. To protect the public health and safety in accordance with DOE's responsibility.
2. To perform the work consistent with safety, security, and environmental protection requirements, and subject to congressional authorization and appropriations.

2199

1. Title and location of project:	Battelle Columbus Laboratories Decommissioning Project (BCLDP) Columbus, Ohio	2a. Project No. D/ND-1.4.14
		2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

3. To conduct D&D activities in accordance with applicable DOE Orders, Federal and State laws and regulations, and consistent with any interagency agreements.
4. To discharge DOE's responsibility under Contract No. W-7405-ENG-92.

The facilities present potential risk to on-site and public safety, health, and environment due to aging building systems and proximity to population. Surveillance and maintenance (S&M) activities are essential to assure adequate containment and site control until remedial actions have been completed and the site is released. At any reduced funding levels, project's activities will be impacted by the need to maintain the level of S&M conducted in individual facilities, especially the JN-1 hot cell facility. Outyear D&D activities will be impacted by the need for additional levels of environmental monitoring and personnel protection conducted in the facilities. Deferment/delay beyond the current baseline schedule will also result in increased cost to protect the health and safety of on-site workers and the general public. Reduced project staff and the inability of the project to fully comply with all DOE requirements in a timely fashion will also occur as a result of reduced funding levels.

Regulatory drivers include: Government contractual obligations as part of contract W-7405-ENG-92; DOE Orders 5400 series for environment, safety, and health; 10 CFR Parts 19, 20, 21, 30, 40, and 70 for compliance with BMI's NRC license (SNM-7) requirements; 49 CFR Parts 171-173, 177, and 178; DOE Order 5480.3 for waste packaging and transportation; 10 CFR Part 1021 National Environmental Policy Act Compliance; 40 CFR Parts 116, 117, 129, 261-265, 268 and 761 Environmental Protection Agency Regulations for Designation and Control of Hazardous Substances and Mixed Waste; 29 CFR Parts 1910 and 1929 Occupational Safety and Health Act (OSHA) Regulations; and DOE Order 5820.2A Radioactive Waste Management.

Specific activities to be accomplished in FY 1997 include:

- Provide only core mandatory S&M activities at the West Jefferson facilities.
- Provide required environmental monitoring and surveillance at the West Jefferson site.
- Provide required indirect support to S&M activities, to include: Radioanalytical Laboratory services, laundry operations, respiratory protection, training, waste management, and dosimetry/bioassay services.
- Provide minimal level project and program management support to the project.

9. Method of Performance

The BCLDP contract administration and specific legal functions are being executed by DOE-CH. The project will be transferred to the DOE-OH in FY 1997. The BCLDP has special circumstances that exist as a result of the closeout of the long-standing Contract No. W-7405-ENG-92. BMI has agreed to participate in a cost-sharing arrangement for the project.

2200

1. Title and location of project:	Battelle Columbus Laboratories Decommissioning Project (BCLDP) Columbus, Ohio	2a. Project No. D/ND-1.4.14 2b. Operating Expense Funded

9. Method of Performance (continued)

The DOE-CH, with DOE-Headquarters (HQ) concurrence, has concluded that it is in the best interest of the Government to have BMI serve as the Dismantlement Operations Contractor (DOC). This is based on the nature of the action under Contract No. W-7405-ENG.-92 (a closeout of the contract), the cost-sharing arrangement with BMI, the agreement on no fee for BMI services, the logistics of the physical situation; i.e., facility owned and operated by BMI, the complicated nature of the joint liability of BMI and the Government, and agreement with BMI to use subcontractors as appropriate. All contract arrangements will be subject to the appropriate review and approvals required by applicable DOE Orders. The DOC will direct the actual decommissioning activities, and will negotiate and award competitively bid, fixed-price subcontracts, as appropriate.

BMI is currently operating under a modification to existing Contract No. W-7405-ENG-92. This modification authorizes BMI to provide S&M of the contaminated facilities in addition to doing the planning and conducting active D&D. This modification was entered into under a cost sharing arrangement. The Government is reimbursing BMI for 90% of incurred D&D costs, except for S&M which is 100% reimbursable.

In order to accurately characterize the BMI site with regard to contamination, and to independently corroborate data made available by BMI, Argonne National Laboratory (ANL) was authorized to provide technical assistance for DOE in the form of cursory site characterization, sampling, and analysis. Under an existing agreement with DOE, ANL was awarded this cost reimbursable segment based on technical expertise, location, and cost. This effort was completed in 1989.

During and at the completion of each element of the D&D activities, the services of an Independent Verification Contractor (IVC) will be required to verify that the work has been completed successfully. The IVC will conduct sampling, testing, and analysis to verify that the established release criteria have been met. The IVC contract will be awarded, funded, and managed by DOE-HQ.

The costs incurred by the participating contractors in the estimated amount of $23,500,000 through FY 1994 will remain on the Chicago Operations Office (DOE-CH) Financial Information System (FIS). However, these costs are included on this data sheet for completeness.

*Current cost estimate reflects appropriated dollars and FY 1996-2001 target funding.

1. Title and location of project:	RMI Decommissioning Project (RMIDP)	2a. Project No. D-1.4.20
	Ashtabula, Ohio	2b. Operating Expense Funded

8. Project Description, Justification and Scope

In 1961, the original buildings of the existing RMI Titanium Company, Inc. (RMI) were modified to house a Government-owned 350-ton extrusion press and process support equipment. From 1962 through 1987, RMI operated the press under prime contract to the U.S. Department of Energy (DOE). In 1987, RMI became a subcontractor to Westinghouse Materials Company of Ohio. During this period, the major mission of RMI was the production of depleted, natural, and slightly enriched extrusions and closed-die forgings to support the DOE manufacturing of fuel and target materials for the Hanford and Savannah River reactors, as well as other sites such as Y-12. Work was also performed for the commercial sector and the U.S. Department of Defense under a Nuclear Regulatory Commission (NRC) license. Through these years of handling, extruding, forging, machining, and processing uranium at the RMI facility, portions of the site and immediately adjacent offsite areas have become contaminated. Due to reduced demand for DOE uranium extrusions, RMI ceased all extrusion activities in 1990 in accordance with DOE direction, and changed its mission to remediation of the facility under the DOE Environmental Restoration Program. The facility retains an active NRC license (SMB-602) for the "possession only" of both natural and depleted uranium.

The RMIDP includes all those activities necessary to the successful decontamination and dismantlement (D&D) of RMI's physical facilities and the affected environment to permit unrestricted use, and to investigate and remediate the Resource Conservation and Recovery Act (RCRA) Corrective Action Management Unit (CAMU). DOE is also liable for a portion of the costs to investigate and remediate a Comprehensive Environmental Response Compensation and Liability Act Superfund site where RMI is a Potentially Responsible Party.

The RMIDP facility is located in a sparsely populated, highly industrialized area of Ashtabula County, Ohio. Several chemical production and metal conversion facilities are located nearby. The site is situated approximately two miles northeast of the City of Ashtabula, one mile south of Lake Erie, and 500 feet south of Fields Brook. Presently, the facility consists of 25 buildings and occupies approximately 7 acres of the 26 acre plant site. Of the 25 buildings on the site, RMI owns 13 and DOE owns the remaining 12 and most of the plant equipment. All land at the site is owned by RMI. All facility buildings are surrounded by a perimeter security fence and access is controlled by a manned guard house.

The contamination of facilities, soils, and ground water with slightly enriched uranium, thorium-234, technetium-99, and solvents has been identified. Radioactive material has been deposited on interior and exterior surfaces of most site buildings and on associated production equipment. Past production operations at the RMI facility resulted in the deposition of radioactive material on surface soil over portions of the plant area and on some adjacent offsite areas. The full extent and level of this radioactive contamination will be characterized.

Past operations also resulted in ground water being contaminated with both radiological and nonradiological contaminants. The extent and level of this ground water contamination will continue to be investigated and will be remediated in order to achieve the decommissioning objective. Effort also included shipment and disposal of contaminated wastes at designated sites.

2204

1. Title and location of project:	RMI Decommissioning Project (RMIDP)	2a. Project No. D-1.4.20
	Ashtabula, Ohio	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The total floor area of the buildings is 115,304 square feet. The highest building is the main plant high bay which is approximately 53 feet high. All other buildings are approximately 20 feet high or less. The estimated volume of contaminated soil to be excavated form onsite and offsite areas is approximately 31,000 cubic yards. The CAMU includes the former evaporation pond, an associated contaminated ground water plume, and the seepage pond 300 feet north of the RMI facility. The seepage pond is at the base of an escarpment which slopes into the floodplain of Fields Brook which runs 500 feet north of the facility. Fields Brook is a designated National Priorities List site.

RMI D&D Project Management (PM):

The PM effort involves the D&D and remediation of the RMI buildings, site and immediately adjacent offsite areas which have become contaminated as a result of work performed at the RMI facility near the City of Ashtabula, Ohio. Effort includes developing design basis for the D&D and remediation efforts, preparing work plans, selecting decontamination and remediation methods, implementing selected methods, and conducting final release surveys. In general, the decommissioning steps for the facility structures will be to remove process equipment and materials, followed by removal of building utilities and services, and then the demolition of the buildings structures.

The PM effort also includes maintenance of project management, project control, administration, and fees consistent with the contract and DOE Orders. It also includes management oversight and monitoring of the subcontractor activities. The specific activities in this category are in two elements: (1) project management, including project control, technical support, quality assurance, administration and training, outreach efforts under the project public participation plan, and technology development; and (2) site services, including surveillance and maintenance, equipment procurement, safeguards and security, and utilities.

The overall project objective is to: (1) decontaminate and decommission the RMI facilities and site for unrestricted use, and (2) remediate a CAMU under RCRA. The project also must fulfill DOE requirements for strategic planning, project management, and reporting; ensure that site workers are trained and medically supervised; and maintain the site in a safe, secure, and accessible condition in compliance with federal, state, and local environmental, safety, and health regulations. This project will fulfill the requirements of the Mission Need Statement by accomplishing the following objectives:

1. To perform a safe, timely, and effective cleanup to minimize contamination release to the environment and personnel exposure.
2. To optimize activities to minimize project duration and costs, consistent with health, safety, security, and environmental protection requirements.
3. To perform the work in accord with the applicable DOE Orders and Federal Regulations identified in the definitive contract between DOE and RMI dated September 30, 1993.
4. To eliminate DOE's contractual liabilities that DOE is obligated to close-out following completed activities of preceding contractors and to remediate and restore the site.

2205

1. Title and location of project:	RMI Decommissioning Project (RMIDP)	2a. Project No. D-1.4.20
	Ashtabula, Ohio	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Additionally, the D&D efforts at RMI are required to meet NRC mandates. In 1990, the NRC developed a Site Decommissioning Management Plan which included the RMI site. In 1992, the NRC published an action plan (57 FR 74) to ensure timely cleanup of these sites in an effective manner. Any funding reductions would produce impacts in meeting the NRC and the Environmental Protection Agency (EPA) expectations for completing decommissioning goals planned in FY 1997.

Environmental regulations are the primary drivers for much of the RMIDP work. RMI, as a NRC licensee is required to meet the requirements of 10 CFR (NRC and DOE requirements) in dealing with nuclear materials, as well as the requirements of 40 CFR (EPA) for environmental compliance issues, 29 CFR (Department of Labor) for worker safety and health, and 49 CFR (Department of Transportation) for packaging and shipping requirements.

Specific activities to be accomplished in FY 1997 include: initiate equipment disposition; initiate onsite soil remediation; initiate Area "c" soil remediation; and initiate CAMU soil remediation.

9. Method of Performance

The RMIDP contract administration and specific legal functions are being executed by the DOE-OH. Primary participants in the RMIDP are the EM-40 Environmental Restoration Program Office in Washington, D.C., the DOE-OH, the DOE RMI Decommissioning Project Office (RMIDPO), and the contractor staff at the RMI Ashtabula, Ohio site. At the Ashtabula RMI site, the site owner and operator is RMI. DOE-OH/RMI will be assisted by a technical support contractor.

RMIPO's acquisition strategy for Environmental Management work at the RMI site is to use the prime contractor as the remediation contractor. As the remediation contractor, RMI manages the day-to-day activities at the site. As the property owner and the remediation contractor, RMI is legally responsible for completing the cleanup. DOE has a contractual relationship to the property owner to facilitate site remediation following previous DOE activities. The remediation contractor will use basic management practices to plan and control the project, and will negotiate and award competitively bid, fixed-price subcontracts for the actual remediation work, as much as practicable.

A technical support services contractor will be utilized under a Cost Plus Fixed Fee basic operating contract with DOE-OH. As support contractor, they will provide the following services to the RMIDPO site office: project management, cost control, budget, schedule, planning, documentation control, technical oversight include quality assurance, radiation protection, safety, and other support services to the OH project manager as required. OH will utilize the DOE support contractor to assist the OH Project Manager in overviewing the performance of the remediation contractor and subcontractor. At the completion of specific elements of the D&D activities, an Independent Verification Contractor will verify that the work has been completed satisfactorily.

Ashtabula, Ohio

2a. Project No. D-1.4.20

2b. Operating Expense Funded

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 0	$ 0	$ 0	$ 0	$ 2,251	$ 2,251
2. Decontamination & Dismantlement	24,300	5,350	9,332	20,284	68,808	128,074
3. Long-term S&M	0	0	0	0	0	0
4. Landlord	0	0	0	0	0	0
5. Compliance Oversight	0	0	0	0	0	0
b. Contingency	0	0	0	0	0	0
Total	$ 24,300	$ 5,350	$ 9,332	$ 20,284	$ 71,059	$ 130,325

NOTE: The RMIDP was transferred to DOE-OH effective April 1, 1995. The costs incurred by the participating contractors in the amount of $23,500,000 through FY 1994 will remain on the DOE-CH FIS. However, these costs are included on this data sheet for completeness. The amounts through FY 1994 are listed below by contractor:

RMI	$17,208
Parsons	4,015
MacTec	2,230
CEGA	47

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

	FY 2001	119,125	0	119,125	119,125

[a] While assessment as a separate phase will be completed in FY 1995, it will continue to be done on an "as needed" basis to support remediation throughout the life of the project.

[b] Current cost estimate reflects appropriated dollars and FY 1996-2001 estimates.

2208

1. Title and location of project:	Richland Environmental Restoration Project	2a. Project No. D-1.4.10
	Richland, Washington	2b. Operating Expense Funded

8. Project Description, Justification and Scope

The overall Richland Environmental Restoration (ER) Project mission includes the identification, assessment, and remediation of the Hanford Site's past-practice waste sites, which have been inactive since March 1, 1987. The identification, transfer and acceptance, surveillance and maintenance (S&M), assessment, and decontamination and decommissioning (D&D) of surplus facilities, as well as post-remediation/post-D&D S&M fall within the project. The ER mission includes the construction and operation of disposal facilities, and the management and support systems necessary to produce quality products.

On May 15, 1989, the U.S. Department of Energy (DOE), the U. S. Environmental Protection Agency (EPA), and the Washington State Department of Ecology (Ecology) signed an agreement to remediate radioactive, chemical, and mixed waste at the Hanford Site over the next 30 years. This agreement is the Hanford Federal Facility Agreement and Consent Order, or Tri-Party Agreement, commonly known as the TPA (Ecology et al. 1992). It contains a blueprint for remediation and uses enforceable milestones to keep the program on schedule.

The main focus has shifted from assessment activities to the acceleration of remedial actions. Emphasis is on the treatment or containment of contaminants in groundwater in the 100 and the 200 Areas; 100 Area remediation to meet unrestricted use criterion by 2018; on-site disposal of remediation waste within the 200 area; 300 area and 1100 area remediation; 200 Area stabilization/containment of contamination; minimizing hazards posed by 200 Area surplus facilities; and stabilizing 100-N Area facilities to minimize potential spread of contamination. Remediation goals will consider the major recommendations emerging from the Hanford Future Site Uses Working Group.

The principal regulatory requirements are the Resource Conservation and Recovery Act (RCRA); the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA); the National Environmental Policy Act (NEPA); the TPA; and the Atomic Energy Act. The Hanford ER Program is planned and executed in accordance with applicable EPA and State guidelines and applicable DOE Orders. The principal D&D regulatory requirements are found in the NEPA, the Clean Air Act, the Occupational Health and Safety Act, and U.S. Department of Energy Headquarters and DOE-Richland Operations Office (DOE-RL) Orders 5820.2A, Radioactive Waste Management.

6209

1. Title and location of project:	Richland Environmental Restoration Project	2a. Project No. D-1.4.10
	Richland, Washington	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Additional Federal standards may be used in developing site-specific remediation levels, such as those derived from U.S. Nuclear Regulatory Commission standards, the Clean Water Act, the Safe Drinking Water Act, and the Toxic Substances Control Act. In addition, CERCLA identifies the circumstances under which State standards may be substituted for Federal standards -- if a State imposes more stringent requirements.

A. SUMMARY SUBPROJECT OVERVIEW

Remedial Actions There are 22 subprojects, including remediation activities in the 100, 200, and 300 areas. These 22 subprojects encompass the assessment and remediation of all 78 past-practice OUs in the Hanford ER program, including groundwater.

The following are specific elements of the OU work scope.

- Manage all work associated with the remediation to include planning, organizing, coordinating, controlling, and directing the work.
- Prepare and update the baseline cost estimates, schedules, and the Activity Data Sheets (ADSs).
- Prepare the task documentation required to plan and complete the specific phase, or combination of phases, of the assessment and remediation process.

D&D Facilities: Includes four active subprojects -- Asbestos Abatement, 100 Area D&D (UB), 200 Area D&D, and N Reactor. At the 300 Area, no D&D activities are currently planned.

Program Management and Support includes two subprojects. The first, Program Management and Support, contains the overall program management for both remedial actions and D&D. It includes quality assurance support; community relations planning support, systems engineering and strategic planning, training, general technical support, including the development of the Hanford Remedial Action Environmental Impact Statement (EIS); laboratory support; and facility, systems, and general infrastructure support. The second subproject covers DOE-RL and compliance/regulatory oversight (State of Washington).

Long Term S&M includes only post-closure or post-remediation monitoring activities.

There are no Landlord activities associated with the Hanford ER Program.

2210

1. Title and location of project:	Richland Environmental Restoration Project	2a. Project No. D-1.4.10
	Richland, Washington	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Treatment, Storage, and Disposal (TSD) includes one subproject, the Hanford Environmental Restoration Disposal Facility (ERDF), for design and construction of a disposal facility required for waste generated from ER remediation activities. The ERDF is a large-scale, RCRA-compliant, disposal unit for permanent waste management of remediated, containerized and bulk waste from past-practice sites.

The ERDF consists primarily of the construction of a single, large evolving disposal trench. TSD also funds the construction of Projects W-025 and W-025A, fully-compliant RCRA trenches in the W-5 Burial Ground. Funding was provided by the ER Program and construction activities were completed in FY 1995. These trenches will be used to accept and store wastes from Hanford CERCLA remediation activities.

The ERDF has been downsized to accommodate budget reductions and lower waste volume projections. These revised assumptions were required to meet TPA milestone M-70-00, to be ready for operation by September 30, 1996.

B. ACTIVITIES TO BE ACCOMPLISHED IN FY 1997

Remedial Actions:

100 Area: Continue semi-annual sampling activities in the 100-KR-4 and 100-FR-3 ground water operable units.

Excavate and remove for disposal 26,800 loose cubic yards, and revise remedial design/remedial action plans for waste sites within 100-BC-1 and 100-BC-2 OUs; continue sampling activities of 24 wells in 100-BC-5 OU. Complete remedial action at the 116-H-1 liquid waste disposal trench; continue remedial design for 100-HR-2 OU; continue semi-annual sampling activities at 100-HR-3. Continue implementation of treatability study program. Conduct treatability studies and remedial design. Begin preparation of 120-D-1 Pond Closure Plan. Complete 100-NR-1 and 100-NR-2 OUs FFS reports and closure plans; conduct annual ground water monitoring activities.

200 Area: Operations of the 300 gpm capacity Pump and Treat system will begin at 200-ZP-1; additional extraction wells will be drilled at 200-ZP-2; will continue to remove carbon tetrachloride at ZP-2; complete construction of barrier at BP-1 and monitor the barrier. Perform stabilization of 200-UP)-1 pump and treat system; 120 gpm capacity Pump and Treat operations begin at 200-UP-1.

2211

1. Title and location of project:	Richland Environmental Restoration Project	2a. Project No. D-1.4.10
	Richland, Washington	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

300 Area: 300-FF-1 remediation will continue and contaminated soils will be excavated and consolidated. 300-FF-5 ground water sampling activities will continue; remedial design will begin. Continue activities at 300-FF-2.

RARA UST: Will continue basic S&M of inactive outdoor radiation areas; will continue ground and aerial application of herbicide to control vegetative growth on inactive waste sites; will continue decontamination/stabilization of contaminated sites by removing top soils and revegetating to control dust and soil erosion; will respond to radiation problem reports, as required.

Continue D&D management support including outyear planning for new project starts such as NEPA compliance, permitting, cultural resource review, and preliminary cost estimates/schedules; will initiate remediation of 100 Area Riverlines; continue S&M of 100 and 200 Area facilities; continue high priority risk assessment collective actions. Initiate demolition of the 190-C Building. Complete Phase I decommissioning, and decontamination of the 233-S project; initiate D&D activities at the 232-Z Facility; Perform 100 and 200 Area repairs as required to maintain safe conditions. At the N Reactor, complete deactivation of all remaining 100 N facilities including the 105N Reactor Building; will complete characterization of N Reactor fuel storage basin sludge and debris and complete N Basin water removal; continue operation of active systems to support 100 Area selected facilities. Asbestos Abatement: will continue asbestos abatement activities focusing on high risk facilities; complete 100% asbestos abatement at 105-C, 165-KE and 151-B facilities; continue regulatory compliance for asbestos management.

Continue overall program management services including project controls, management, reporting, and baseline planning; will continue development of various Major Systems Acquisition management systems and plan; will continue maintenance and operations of administrative records; prepare over 60 regulatory reports; continue TPA support; prepare and document results of public meetings, support project and sitewide planning and integration; make equipment purchases to support RI/FS activities; will continue quality assurance report; will continue quality assurance training; will continue to support activities such as cost estimating, grants and compliance oversight; continue to maintain the Hanford Remedial Action EIS; conduct systematic safety, health and environmental assessments (24 assessment and 20 compliance reviews); develop environmental compliance strategies (10 issues); interface with the Hanford Analytical Services Management to ensure effective utilization of on-site laboratories, to contract for off-site laboratories to perform Contract Laboratory Program (CLP) analyses and enhance CLP sample database tracking; continue to support HEIS, WIDS, and the Geographic Information System and general investigation studies. Will update the RI/FS baseline; support historical scoping studies, continue investigation of future suspect waste sites; continue to support purge water; will continue to support the Hanford Prototype Barrier, work on Price Anderson Amendment Act rules; complete development of Hanford Geological Model for Vadose Zone; and field demonstration of new technologies focusing on D&D, soil remediation, and ground water.

2212

1. Title and location of project:	Richland Environmental Restoration Project	2a. Project No. D-1.4.10
	Richland, Washington	2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Planning and outyear activities for laboratory support provides for the administration of Hanford analytical services, including management of commercial laboratory contracts. As a result of changing strategy under the refocusing ER Program, equipment costs have been moved from this subproject to the remedial action subproject, where these costs are directly supported.

S&M: Commence ground waste monitoring for the 300 and 1110 Areas consistent with the approved operating and management plans.

Disposal Facility: Continue facility construction, partially support operation and transportation requirements, complete project documentation and closeout, and continue regulatory reviews and interface.

Regulatory Drivers/Consequences:

TPA: All ERDF activities are affected by the TPA, an agreement and schedule between DOE, EPA, and Ecology for the remediation of the past practice waste sites at Hanford. If the ERDF remediation activities are not funded (resulting in remediation delays), the consequences will be continued public, worker, and environmental risks, and increases to the final cost of remediation due to inflation. Failure to meet the TPA schedule milestones could result in EPA assessing penalties of up to $5,000 for the first week and up to $10,000 for each additional week. In addition, Ecology may initiate judicial enforcement of the TPA.

CERCLA: As amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), CERCLA provides EPA enforcement authority for remediating contaminated subproject waste sites, and is part of the regulatory authority for the TPA. If ERDF remediation activities are not achieved per CERCLA, then enforcement actions are similar to enforcement provisions provided in the TPA. The DOE could be subject to additional enforcement actions outside of the TPA under CERCLA.

RCRA: As amended by the Hazardous and Solid Waste Amendments of 1984 (HSWA), RCRA provides Ecology enforcement authority for treatment, storage, and disposal units under RCRA Section 3004. If ERDF remediation activities are not achieved per RCRA, then enforcement actions under RCRA are similar to enforcement provisions provided in the TPA. In addition, under RCRA Section 3008, DOE could be subject to both civil and criminal enforcement sanctions for violations of the RCRA hazardous waste program.

NEPA: Application of NEPA to the ERDF is to ensure that potential impacts of assessment and remediation activities are evaluated. NEPA values were incorporated into the CERCLA Record of Decision for this subproject. This was a pilot program to integrate these two bodies of regulation into a single process.

2213

1. Title and location of project:	Richland Environmental Restoration Project Richland, Washington	2a. Project No. D-1.4.10 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

DOE Orders: Various DOE Orders (e.g., 4700.1, 5700.2D, etc.) provide and/or implement best management practices for policy and guidance to execute the ER Program. The project scope, cost, and schedule are a direct result of conforming to these various orders. Failure to fully comply with DOE Orders may result in increased risk to safety, human health, and the environment. Additional risks may result (e.g., project delays, uncontrolled costs, and delivery of incomplete or unacceptable products).

The scope of the ERDF subproject (ADS 3700) includes the following major efforts: 1) Project management and engineering support; 2) Design of the ERDF; 3) Construction of the initial complement of disposal cells; 4) Transportation of remediated material to the ERDF; 5) Controlled backfill operations of remediated material; 6) Construction of additional ERDF disposal cells; and 7) Construction of ERDF disposal cell covers.

9. Method of Performance

The Environmental Restoration Contractor, Bechtel Hanford, Inc. (BHI), is the major participant responsible for the overall management of the Hanford Site ER Project. BHI has three pre-selected subcontractors which will participate in the fulfillment of the project: CH2M Hill Hanford, Inc., IT Hanford, Inc., and Thermo Analytical, Inc. In addition, BHI will utilize fixed-price remediation contracts, awarded through a competitive bidding process, as needed. The baseline strategy for the Hanford ER Project is to complete the scope of work included in the approved WBS, and, in doing so, meet all TPA milestones.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 669,006	$ 130,272	$ 113,839	$ 90,863	$ 327,583	$ 1,331,563
2. Decontamination & Dismantlement	118,360	44,916	41,304	37,036	141,847	383,463
3. Long-term S&M	0	0	910	200	800	1,090
4. Landlord	0	0	0	0	0	0

2216

1. Title and location of project:	Rocky Flats Environmental Technology Site (RFETS) Environmental Restoration Project Golden, Colorado	2a. Project No. D-1.4.7 2b. Operating Expense Funded

8. Project Description, Justification and Scope

The RFETS occupies approximately 400 acres in the midst of a 6,150 acre site. The industrial land use in the developed area of the plant site is surrounded by a buffer zone which is over a mile wide. Land use in the buffer zone would be classified as "vacant" except along the western side where gravel quarries exist. To date, 178 Individual Hazardous Substance Sites (IHSS) have been identified at RFETS. The quantity of contaminated soil and ground water will be determined during the operable unit (OU) remedial investigations. The 178 IHSSs have been grouped according to geographic location and contamination types and prioritization.

Remedial Actions:

The remedial activities encompass assessment and cleanup of 178 IHSSs. These sites are grouped into 10 OUs. Site characterization, assessment, and remediation activities on IHSSs are being carried out within the OU structure. Activities include:

- Work plan preparation, Resource Conservation and Recovery Act (RCRA) Facility Investigation/Remedial Investigation field work and sample collection, sample analysis, data validation, data analysis and modelling, feasibility studies, environmental evaluations, risk analyses, corrective action documentation and implementation, and accelerated removal actions to reduce on-site contamination. Specifically, No Further Action Documentation will be submitted for OUs 1, 3, 11, 15, and 16.
- Conduct Solar Ponds (OU4) sludge processing per agreement with the regulatory agencies; design and construct RCRA closure cap to contain on-site contamination; continue treatment of potentially contaminated water; excavate, treat, and transfer soil.
- Site-wide support activities include planning, monitoring, and reporting of ongoing activities in the RFETS Environmental Restoration Program, quality assurance activities, and community relations. The Treatment/Storage/Disposal facilities comprise decontamination facilities and waste handling facilities that are designed, constructed, and operated for use by multiple OUs, as well as, operation of an on-site analytic laboratory for short-term turnaround of soil and water samples for shared usage among multiple OUs. Additionally, technical direction and integration of environmental restoration risk assessment and technology development activities are carried out in support of interagency agreements.

Remedial activities are carried out under RCRA and Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), and under the provisions of the interagency agreement with the Environmental Protection Agency and the Colorado Department of Public Health and the Environment.

Decontamination and Dismantlement

When funding permits, D&D of surplus buildings, utilities, and equipment that have been transferred and accepted into the ER Program will be initiated

2217

1. Title and location of project:	Rocky Flats Environmental Technology Site (RFETS) Environmental Restoration Project Golden, Colorado	2a. Project No. D-1.4.7 2b. Operating Expense Funded

9. Method of Performance

The Deputy Assistant Secretary for Environmental Management has been assigned programmatic responsibility for the Department of Energy (DOE) Environmental Restoration Program. The Rocky Flats/Nevada Division (EM-452) in the Office of Southwestern Area Programs is the project management organization at DOE Headquarters for the Rocky Flats Environmental Restoration Project. The Environmental Restoration organization in the Rocky Flats Office has been delegated day-to-day project management responsibility and has established a dedicated Project Office at the site.

The Rocky Flats Field Office will provide technical, administrative, and financial management of the project. EG&G Rocky Flats, Inc. was the prime Management and Operating integrated contractor for all work at the site until June 30, 1995, and was responsible for overseeing all project and subproject activities at the site. As of July 1, 1995, the Kaiser-Hill Company assumed responsibility for operation of the site. Subcontractors are utilized for construction and remedial actions, surveillance and maintenance, and ensuring completion of the project in accordance with DOE guidance. ER activities are being integrated with other plant transition activities to ensure optimal and efficient use of resources.

2220

1. Title and location of project:	Liquid Waste Treatment Upgrades, Rocky Flats Environmental Technical Site, Golden, Colorado	2a. Project No.: 93-D-178 2b. Operating Expense Funded

8. Project Description, Justification and Scope

a) Building and Equipment

This project will upgrade liquid waste treatment capabilities at Rocky Flats. The project as currently scoped will consist of 13 subtasks as follows:

1. Waste Receiving

   Replacement of level, flow, and pH instrumentation and associated piping and components.

2. Precipitation

   Replacement of vessels, filters, agitators, and pumps, including associated piping and instrumentation.

3. Acid Neutralization

   Replacement of level and flow instrumentation.

4. Filtration

   Refurbishment of the feed tanks with level instrumentation, decanters and associated piping. Rebuild the two rotary drum vacuum filters, replace plugged lines and replace the vacuum pumps and support equipment.

5. Sludge Immobilization

   Removal of the old sludge dryer and obsolete direct cementation process glovebox. Installation of new belt conveyer and improved wet sludge immobilization equipment.

22221

8. Project Description, Justification and Scope (Continued)

6. Vent Scrubber

Replacement of control and monitoring instruments, blower control circuits, circulating pumps; reconfiguration of inlet ducts and addition of sound barriers for personnel protection.

7. Chemical Preparation

Replacement of the solids conveyor, tank agitators, pumps, level instruments and associated piping. Addition of a new phosphoric acid supply tank, a stainless steel liner for the chemical tank basin, and a sump system and lining to the caustic tank basin.

8. General Building Upgrades

Replacement of the existing PVC floor drains with stainless steel pipe, and replacement with a distributed control system which will include a data acquisition system to log process data.

9. New Product Waste Storage Tank

Installation of a third 100,000 gallon product water holding tank to allow analysis of product water prior to release. This will include upgrading of the basin around the existing product water tanks.

10. Rebuild Berm Around Chemical Tanks

Upgrade of the existing berm around the nitric acid, sodium hydroxide, and potassium hydroxide storage tanks and furnish pumps to transfer spills into Building 374.

11. Wastewater Storage Tanks

Installation of two new 950,000 gallon wastewater storage tanks near Building 374 to provide surge capacity for the evaporator feed water. The new tanks will be located within the protected area and within 500 feet of Building 374.

2222

8. Project Description, Justification and Scope (Continued)

12. Waste Transfer System

Installation of instrumentation to monitor and transmit waste tank level and flow data to the data acquisition system in Building 374 for all plant waste transfer stations.

13. Chemical Preparation Area Ventilation

Isolation of chemical preparation area exhaust ventilation from main Building 374 exhaust ventilation system. This will include a new acid scrubber.

b. Special Facilities (Part of subtask 8)

Data Acquisition System

Building 374 originally shared a data acquisition system (DAS) with Building 371 but the DAS has been taken out of service. A new and independent DAS system is required for Building 374 that will monitor not only the incoming waste streams (as the original DAS did), but also be capable of collecting essential operating data for the entire liquid waste treatment facility. This DAS system would receive its input from the field terminals in the rear of the main control room. These input would be wired in parallel with all the associated indicators, recorders, controllers and alarm annunciators already existing in the main control room panel which will be replaced with a new distributed control system (DCS). There will be no control signal output from the DAS, since existing, or new replacement distributed control system based indicating control station shall be used for Proportional, Integral, Deviative (PID) control.

The system has been estimated for a total of 159 analog, 126 digital and 36 thermocouple inputs. The A-E shall determine during the Title Design stage the exact number of inputs needed.

Data acquisition from remote termination units (RTU's) for the waste transfer stations are also included in the DAS.

c) HVAC and Utilities (Part of subtasks 9)

Separate ventilation of the chemical preparation rooms will consist of an acid scrubber. A packed bed acid scrubber will be required for acid tanks vents.

2223

8. Project Description, Justification and Scope (Continued)

Building 374 began operations in 1979 and no major replacement of systems has occurred since. The facility is operating with three temporary systems, installed on highly accelerated schedules to meet WIPP waste form requirements for TRU sludge and new DOE requirements for transporting salt. The existing data acquisition system does not allow recording of all operations data required for monitoring agencies.

If the upgrade of the Waste Treatment Facility is not supported, continued operation of the facility will be in jeopardy. This is due to:

1. Continuing deterioration of the process equipment through wear and obsolescence.
2. New legal requirements on waste management and containment.
3. Data acquisition and recording requirements for reviewing agencies.
4. New waste form requirements to meet future shipping and storage requirements.
5. Stricter management of recovered process water.

Successful operation of the Rocky Flats Environmental Technical Site (RFETS) will become increasingly dependent on having a compliant, latest technology waste treatment plant. This project will provide such a waste treatment plant.

A study of the condition of the Rocky Flats Process Waste Treatment Facility, Building 374, has revealed deterioration and obsolescence of the process equipment and facility. Stricter waste management and reporting requirements recently imposed by the DOE and EPA cannot be met with existing equipment. Building 374 processes all process aqueous waste generated at the RFETS. Environmental restoration and transition activities will result in an increased load on the Waste Treatment Facility. Significant upgrades of all processes are required to ensure that this facility can continue to operate within the RCRA reporting requirements.

Upgrade of the waste treatment facility will provide compliance with applicable regulations within RCRA monitoring and controlled processing. Upgrades will also provide the capability to process wastes forms to specifications of the Waste Isolation Pilot Plant (WIPP) and the Department of Transportation (DOT). Failure to proceed with Building 374 upgrades may inhibit the ability to maintain waste management operations within legal requirements imposed by the Resource Conservation and Recovery Act (RCRA) and jeopardize the capability of the facility to support environmental restoration and transition activities due to increasing loads on the waste treatment facility.

A recent study performed by the site contractor has identified potential opportunities to consolidate waste water management at RFETS. This integrated approach also identifies cost and schedule savings based upon the construction of a temporary (10 yr-life) facility to provide treatment capability for waste streams currently sent to B-374 and closure of B-374. DOE is currently evaluating this proposal. If found to be a better investment capable of meeting the sites needs, appropriate documentation will be approved to modify the project scope.

2224

1. Title and location of project:	Liquid Waste Treatment Upgrades, Rocky Flats Environmental Technical Site, Golden, Colorado	2a. Project No.: 93-D-178 2b. Operating Expense Funded

9. Method of Performance

Design will be on the basis of (a) negotiated architect-engineer contract. Construction and procurement will be accomplished by CPFF contract, utilizing fixed-price subcontracts to the extent feasible awarded on the basis of competitive bids, because all of the work will be in the PSZ.

2228

8. Project Description, Justification and Scope

This project is being consolidated based on FY 1996 House and Senate language to provide program flexibility. These construction projects at Rocky Flats Environmental Technology Site (RFETS) are for mixed waste and low-level waste treatment systems. The subprojects listed below will be addressed individually in the data sheet and must undergo the same review process as any other construction line item proposed in the budget. Since changes occur on a real time basis and cannot be anticipated, this consolidated line item approach will provide DOE the flexibility to react to significant technical, programmatic, and regulatory changes that impact the programs. Three projects have been identified for inclusion in this line item.

The purpose of these projects is to provide treatment capacity and capability for low-level, mixed waste (LLMW) sludge and similar waste forms generated from liquid waste treatment operations in Buildings 374 and 774 for compliant storage, transportation, and disposal. Treatment of these wastes is required to meet Resource Conservation and Recovery Act (RCRA)-Land Disposal Restriction (LDR) regulations, Department of Transportation (DOT) shipping regulations, Federal Facility Compliance Act (FFCAct) requirements, and disposal site Waste Acceptance Criteria (WAC). There is presently no capability on-site to meet the regulatory requirements specified for these wastes.

These systems and the treatment technologies were developed through implementation of the mixed waste Federal Facility Compliance Agreement II Comprehensive Treatment and Management Plan (CTMP). During this implementation, the FFCAct of 1992 was enacted, which required each DOE site, which generated mixed waste, to develop treatment capacity to meet RCRA treatment standards for that mixed waste. Pursuant to the FFCAct, Rocky Flats entered into a compliance order with the State of Colorado to implement the Site Treatment Plan (STP) which replaced the CTMP and set new enforceable milestones. The proposed STP continues the program previously committed to in the CTMP with schedule adjustments based upon funding constraints.

The DOE is committed to compliance with environmental laws and regulations as well as safety and health requirements. The lack of support for LLMW capital projects proposed as LLMW treatment systems could result in non-compliance with outyear FFCAct milestones. The FFCAct milestones are enforced by the regulatory agencies under Section 3006 and 3021 of RCRA. All plant activities that generate mixed waste, outside of those activities necessary to maintain plant health and safety operating envelopes, would be suspended. The EM mission to deactivate production buildings and stabilize materials would be drastically curtailed. In addition, the EM-30 mission to minimize toxicity, reduce safety and health risks to the workers, public and the environment as well as minimizing the volume of the LLMW forms planned for this treatment system would be disrupted and delayed.

2229

8. Project Description, Justification and Scope (continued)

a. Subproject #01 - CTMP Immobilization of Miscellaneous Wastes
(former)

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	CONSTRUCTION DATE - COMPLETION DATE
$ 11,900	$ 0	$ 0	$ 1,400	$ 1,500	$ 9,000	3rd Qtr. FY 2000 4th Qtr. FY 2003

This project will provide a system to treat and solidify LLMW. These various waste forms have been generated in both the production buildings and laboratories located at the RFETS. The treatment system will be constructed within an existing structure at RFETS and the project will include all retrofits to the existing facility necessary to support the immobilization treatment utility systems.

This project addresses Cementation and Polymer solidification technologies for immobilizing LLMW utilizing commercially available equipment to comply with the RCRA-LDR requirements and the Nevada Test Site (NTS) Waste Acceptance Criteria (WAC).

The preferred location for the Immobilization of Miscellaneous Wastes forms will be an area located within Building 776 (Room 158). Locating the process within this building will enable the immobilization process to be positioned within close proximity to other waste operations and utilize the existing liquid waste treatment system currently in operation in Building 374/774.

The current design concept requires an estimated 4,400 square feet of floor space. The facility to treat and immobilize miscellaneous wastes would consist of the following:

Bulk Storage: The bulk storage area will contain pallets containing bags of cement, additives, and low density polyethylene (LDPE) to be used for the immobilization processes. The area would be sized to accommodate 5 pallets of approximately 600 square feet of floor space.

Material Handling: The facility will require a material handling system to transfer waste drums and process feed materials. Equipment required would consist of: Drum Handling/Dumping Equipment, Live Roller Conveyor, Drum Filling Equipment, Size Reduction and Waste Sorting. This equipment will require approximately 400 square feet of floor space.

2230

8. Project Description, Justification and Scope (continued)

Pretreatment: The pretreatment area will consist of equipment to open waste containers containing liquids, precipitate silver neutralize acids and/or analytical lab solutions. The resulting liquids will be treated in Building 374. The silver precipitant will be treated by the immobilization treatment operation. The pretreatment operation will require approximately 160 square feet of floor space.

Immobilization: The immobilization area will contain equipment to mix cement, melt and extrude LDPE, feed waste, and fill drums for the immobilization of various waste forms within glovebox confinement. The immobilization equipment will require approximately 800 square feet of floor space. The polymer immobilization will contain extruders for both polymer microencapsulation and polymer macroencapsulation.

Miscellaneous Plutonium Recovery By-Products: The processing of miscellaneous plutonium by-products will not require the removal of existing equipment within Building 779. However, upgrades to the equipment will be required prior to operation and will be provided through operations funding.

b. Subproject #02 - CTMP Building 374/774 Sludge Immobilization
(former)

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	CONSTRUCTION DATE - COMPLETION DATE	
$ 18,200	$ 0	$ 0	$ 1,500	$ 0	$ 16,700	To be determined	To be determined

This subproject was originally proposed as a FY 1996 New Start but has been deferred to the outyears due to funding constraints.

This project will provide a system to treat and solidify LLM wastes. These various waste forms have been generated in both the production buildings and laboratories located at the RFETS.

This project will also provide for adequate process system ventilation for the Building 774 Annex area. The waste is produced in Buildings 374/774 Liquid Waste Treatment Operations (LWTO), and does not consistently meet NTS or Waste Isolation Pilot Plant (WIPP) WAC. The technology used will be chosen between Microwave Solidification, Polymer Immobilization, or Cementation after the downselect analysis of the Technical Selection Decision Document.

2231

1. Title and Location of Project: Mixed Waste/Low-Level Waste Treatment Projects, Rocky Flats Envr. Tech. Site, Golden, Colorado	2a. Project No.: 96-D-407 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The treatment process is proposed to be located in the Building 774 Annex (Room 250). This has been selected due to its proximity to the Buildings 374/774 waste stream processing operations, the services available in the area, and that it is presently not occupied.

Building 774 Annex is presently vacant, so only limited construction removals are expected. The treatment facility will contain all drum opening and handling equipment, waste material and additive transfer equipment, temporary storage space in the form of silos for the additives, a staging area for untreated wastes due for treatment, space for sludge preparation, treatment processes, air monitoring and processing equipment, and a staging area for treated wastes to be stored until shipment from the building to RCRA storage or to a final disposal site. It is expected that 1,100 square feet of space will be necessary, not including primary storage space. The roof of Building 774 Annex will require new construction in the form of a second floor addition to house HVAC, air monitoring and processing equipment, required to support the treatment process.

The selected location is an open area with 13 foot high ceiling. The full Sludge Immobilization System will be contained within the first level of this facility with the exception of annex equipment and primary storage space. A standard oil-gas monitoring system for anticipated maximum levels of 500 ppm of oxides of nitrogen (NOx) and oxides of sulphur (SOx), trace amounts of Volatile Organic Compounds (VOCs), and radionuclides at an anticipated level of 10.6 grams/gram Pu will be necessary. Connection to the Building 774 HVAC system for the 774 Annex will be necessary.

The treatment system will utilize equipment to perform sorting, size reduction, solid material handling, emissions pollution control, immobilization and packaging of LLMW forms. The treated waste form will be compliant with the LDR standards of RCRA and the WAC for shipment to the NTS for final disposal. The immobilization components for LLMW Bypass Sludge will utilize one of the following three candidate technologies; Polymer Solidification, Microwave Solidification or Cementation. These technologies have been reliably demonstrated to produce leach resistant final waste forms that meet LDR standards. An additional benefit of the polymer solidification and microwave solidification technologies is the waste minimization provided through volume reduction.

The immobilization process minimizes the toxicity and exposure to the hazardous constituents found in these LLMW. The treatment system thereby reduces the safety and health risks associated with the storage and disposal of these wastes forms to workers, the public, and the environment by implementing an effective and efficient system to treat and minimize LLMW.

2232

8. Project Description, Justification and Scope (continued)

c. Subproject #03 - CTMP Surface Organic Contaminant Removal

(former) TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	CONSTRUCTION DATE - COMPLETION DATE
$ 15,300	$ 0	$ 0	$ 0	$ 800	$ 14,500	2nd Qtr. FY 2002 — 1st Qtr. FY 2005

The CTMP System 5-Surface Organic Contaminant Removal Treatment System (SOCR) project will treat LLMW to remove Volatile Organic Compounds (VOCs) and Semi-Volatile Organic Compounds (SVOCs). This treatment system will treat 12% of the LLMW backlog and newly generated wastes at RFETS. Newly generated waste amounts are based on a ten-year life of the project starting in 2003.

The treatment technologies presented here are Low Temperature Thermal Desorption (LTTD) for VOC and SVOC contaminated wastes and Super Critical CO_2 Extraction ($SCCO_2$) for SVOC contaminated wastes. These technologies will treat waste classified as mixed hazardous debris to treatment standards defined in 40 CFR 268.45 Table 1, to meet land disposal restrictions (LDR). LTTD is a thermal extraction technology and $SCCO_2$ in a chemical extraction technology.

The Thermal Desorption technology utilizes heat vacuum to pull VOCs from mixed wastes. The technology is currently used commercially for soil and sludge contamination cleanup. A demonstration of the LTTD with both granular activated carbon (GAC) capture and non-thermal plasma (NTP) destruction of described VOCs will be conducted on actual mixed combustible waste in 1995. The demonstration will be conducted in the tent 10 permacon.

The $SCCO_2$ technology utilizes carbon dioxide which, when in a super critical state, is an excellent solvent to remove SVOCs and VOCs from the waste. This technology has been used in industry for various applications ranging from extracting caffeine from coffee beans to cleaning circuit boards. A demonstration unit is operating at the University of Colorado measuring extraction coefficient for SVOC and VOC from surrogate Rocky Flats waste, and a demonstration unit is operating at Los Alamos National Laboratory for radiological contaminated waste.

The SOCR project is located in Building 776, Room 158 at RFETS. The room is located in a metal building addition located in the northwest corner of Building 776. The building addition was added to Building 776 in 1966. This project will renovate 2,400 square feet of the addition in an area presently configured as a maintenance pipe shop (the building user is not utilizing the pipe shop).

2233

8. Project Description, Justification and Scope (continued)

Another CTMP project (Immobilization of Miscellaneous Wastes) is also located in room 158. The two projects benefit from this proximity. Some of the proposed facility can be shared saving capital dollars and operational costs.

Examples of operation cost savings include:
- Wastes that require immobilization after SOCR treatment can easily be transported to the Immobilization equipment.
- Shared drum opening and sorting facilities allow wastes that cannot be treated by one system to be processed by the other without having to be redrummed and 'bagged out'.
- More efficient use of personnel such as Radiation Control Technicians.

Examples of capital costs savings include:
- Shared glovebox for sorting.
- Shared contamination control cell.
- Shared Heating/Ventilation and Air Conditioning (HVAC).

The majority of required utilities for the SOCR project presently exist within Room 158. Utilities include electrical power, Life Safety/Disaster Warning (LS/DW), telephone service, and Heating/Ventilation and Air Conditioning (HVAC).

This project includes the planning, design, construction and preparation of a treatment system to treat the RFETS LLMW forms whose surfaces have been contaminated with VOCs, are inherently hazardous, and do not meet the LDR requirements. The treatment system will utilize equipment to perform sorting, size reduction, solid material handling, separation of organics from the surfaces of the bulk material, stabilization and packaging of the treated waste form. The recovered organics will be treated by other CTMP systems. The remaining solid materials will be immobilized by macroencapsulation with polymer or cement.

This treatment system will be used to treat 19 LLMW forms, including six waste forms that must presently be treated under RCRA prior to disposal. The LLMW forms are contaminated with VOCs consisting primarily of chlorinated solvents. The wastes identified for treatment by this system consist of accumulated inventory as well as waste forms that will continue to be generated and accumulated during decontamination and decommissioning activities at the RFETS.

Approximately 2,400 square feet of space will be needed to house the overall process equipment, process consumables and to provide storage space for both treated and untreated LLMW forms.

2234

9. Method of Performance

The method of performance will vary with the project and plant location. At RFETS and for these projects, predecisional design work will be performed by the Site Contractor. Title design will be performed by an Architect-Engineering (A-e) firm under a Fixed-Price contract, and construction will be completed by a Cost-Plus-Fixed-Fee Contractor. The feasibility of pursuing a design-build contract to potentially reduce costs is being analyzed.

10. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1995	FY 1996	FY 1997	Outyears	TOTAL
a. Total facility costs

2001	10,360 c/	0	10,360 c/	5,000
2002	0	0	0	5,360

* Appropriated as construction funding.

Note: This project was established in FY 1994 from transferring subprojects from Defense Programs project 88-D-122, Facilities Capabilities Assurance Program, Various Locations.

a/ Adjustment reflects Defense Programs FY 1993 general reduction.
b/ Reflects congressionally mandated rescission.
c/ The present consolidation effort at Rocky Flats may require additional funding for Defense Nuclear Facility Safety Board requirements in the 371 Area. This scope of work is under review.

1. Title and Location of Project: Infrastructure Replacement, Rocky Flats Plant, Golden, Colorado

2a. Project No.: 94-D-451 ADS# RF-6751

2b. Operating Expense Funded

8. Project Description, Justification and Scope

The total estimated cost is $56,353,000 and the total project cost is $58,714,000.

The objective of the Infrastructure Replacement project is to replace electrical, mechanical, or other infrastructure systems and to manage the continuing deterioration of the Rocky Flats aging facilities. The primary utilities systems were designed and built in the 1950's. The project will address utility capacity and capability and ensure vital safety systems remain operable throughout transition and decontamination and decommissioning (D&D) activities and to ensure worker safety and health. The subprojects within this project originated as part of Defense Programs' Facilities Capabilities Assurance Program (FCAP) project (88-D-122), whose objective was to maintain production capability by replacing obsolete and inadequate facilities. As an Environmental Management site transitioning to D&D and/or reuse, the planned waste treatment and D&D activities still require that vital safety and utility systems remain operational in order to ensure worker safety and health and protection of the public.

The following is a brief description and justification for each of the subprojects. For clarity, all four subprojects are presented, not just those proposed for FY 1997 funding. Each of these subprojects is being reviewed for possible descoping in light of the new mission at Rocky Flats; however, the need for the subprojects remains viable. The reduced TEC of the projects reflects descope of the subprojects due to mission descoping.

Subproject 88-01 - Electrical Distribution System Replacement and Upgrade, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1994	FY 1995	FY 1996	FY 1997	FY 1998	Construction Start - Completion Dates
$ 27,353	$ 15,103	$ 3,100	$ 3,760	$ 2,940	$ 2,450	$ 0	2nd Qtr. FY 1989 - 4th Qtr. FY 1998

The total estimated cost of this subproject, has decreased from $35,160 to 27,353.

2238

8. Project Description, Justification and Scope (continued)

This project is necessary to provide the required reliability of electric services to all facilities at the Rocky Flats Plant. The major portion of the existing system and equipment was installed in the early 1950's and is reaching or has reached its design life, which presents major maintenance problems due to the lack of parts availability. The expansion of plant facilities has caused the capacity of sections of the electric system to be exceeded. In addition to the influence of load growth on component capability, ratings of the components in many cases is indeterminate due to modifications or repairs made to the equipment under numerous emergency "make-do" repair situations. These factors limit the ability of the system to serve present loads and could result in serious reliability and safety concerns. Changing environmental and plant operating conditions have made it necessary to update and modify the electrical system load forecasts. These recent forecasts have been revised to agree with actual measured loads that show reduced load growth and a peak estimated demand load through 1994 of about 36 MVA or 29 Mw.

This project is necessary to correct known Rocky Flats Plant (RFP) electrical system deficiencies and assist in sustaining the present and future capabilities of the Plant wide Electrical Distribution System. It will provide reliable electric service, improve operational flexibility for existing loads, allow for future expansions at the Rocky Flats Plant required by future decontamination and decommissioning and waste operations, and includes: (1) construction of a new 115/13.8-kV substation (2040 square feet); (2) installation of an upgraded 13.8-KV overhead distribution system which will include upgrading the existing 22-4 MVA substations inside the Protected Area, and removal of part of or all three existing substations. Based on current Budget Authority (BA) Targets, this project will not be supported in outyears (FY 1998 and out), and therefore Budget, Scope, and Schedule to support this project has been deleted; and, (3) replacement of the B881 transformers.

The DOE General Design Criteria Manual 6430.1A states "Where a high degree of service reliability is required for operating or safety reasons, two separate supply services shall be provided, physically separated and served from separate supply sources, to minimize the possibility of simultaneous service outages from natural or other causes." The existing system at the RFP complies with this requirement by having two transformers in the main substations, each capable of carrying the total substation load. When the total substation load exceeds the capacity of one transformer and an emergency situation such as loss of transformer occurs, the combined load cannot be carried for an extended period, resulting in outages to facilities.

This situation existed at two substations for a brief period during 1985-1986 but has been temporarily remediated by load transference from the overloaded substations to another substation, which had adequate capacity. Replacing three of the four existing 115/13.8-kV substations with the 21/28/35/39.2MVA substation will eliminate overloading problems by increasing plant transformer capacity for future load growth and will provide increased operational flexibility. In addition to the substation capacity problem, there are serious operational concerns with the system's configuration and the deteriorated condition of existing equipment. Some substations equipment is so outdated that spare parts are no longer manufactured, which causes severe maintenance problems. Additionally, the system's configuration can result in the overloading of alternate feeders during emergency switching.

23-254 96 – 71

2239

8. Project Description, Justification and Scope (continued)

Construction of the new 21/28/35MVA substation began in FY 1996 and will be completed in FY 1998. It will meet the capacity requirements for load forecasts through at least the year 2015. The load forecasts are expected to accommodate a changing plant mission.

In addition to the existing overhead distribution system capacity problems, there are several other inherent problems with its design and condition. The overhead wires are of two different metals, aluminum and copper. Many of the connectors used throughout the system are not suitable for aluminum-to-copper connections. The connections create "hot spot" conditions that have been detected through infrared testing. These hot spots can lead to fault conditions that disrupt electric service to critical facilities.

Construction of a new underground distribution system was canceled early in 1990 because of environmental barriers when performing necessary excavation. Development of upgraded overhead 13.8KV system has been undertaken to alleviate problems with the present overhead system.

Construction of the B881 transformer/generator replacement project began in February 93. The contract was awarded 11/13/92. Three existing transformers in B881 came from World War II Liberty Ships and could fail at any time. They are loaded to capacity. In addition, the Plant computer facility and the Plant analytical labs are housed in B881, and are dependent on these aging transformers. The B881 is a contaminated building that requires maintenance of its mechanical systems.

2240

Subproject 90-02 - Building Electrical Rehabilitation, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1994	FY 1995	Construction Start - Completion Dates
$ 5,500	$ 4,700	$ 0	$ 800	2nd Qtr. FY 1993 - 4th Qtr. FY 1995

This project will upgrade the electrical systems in buildings throughout the Department of Energy's Rocky Flats Plant. This upgrade is necessary to meet current and projected plant mission requirements.

8. Project Description, Justification and Scope (continued)

Subproject 91-03 - Central Steam Plant Renovation, Rocky Flats Plant, Golden, Colorado

TEC	Previous	Construction Start - Completion Dates
$ 3,300	$ 3,300	3rd Qtr. FY 1994 - 3rd Qtr. FY 1995

The completion date for this subproject has changed from 4th Qtr. FY 1994 to 3rd Qtr. FY 1995.

This subproject provided system reliability and energy conservation by upgrading and renovating the central steam plant at the Department of Energy's Rocky Flats Plant.

This subproject has been completed.

Subproject 93-04 - Plutonium Facilities Heating, Ventilation, and Air Conditioning Restoration, Rocky Flats Plant, Golden, Colorado

TEC	Previous	FY 1995	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	Construction Start - Completion Dates
$ 20,200	$ 4,300	$ 5,540	$ 0	$ 0	$ 0	$ 0	$ 0	$10,360	1st Qtr. FY 1996 - 4th Qtr. FY 2002

The completion date has changed from 4th Qtr. FY 1997 to 4th Qtr. FY 2002 due to budget restrictions.

The project will restore the aging Heating, Ventilating, and Air Conditioning (HVAC) systems in the Plutonium (Pu) facilities at the Rocky Flats Plant. This work will include renovation or upgrade of supply, return, and exhaust air systems, cooling equipment, air compressors, cooling towers, air dryers, air compressors, and instrumentation and controls.

This project will revitalize HVAC and utility systems which are critical to continued contamination control within the Rocky Flats Plant. Portions of this project will ensure that radioactive contamination spread within the buildings is contained should the primary containment systems fails. The remaining work will ensure that temperatures, humidities, and cleanliness are maintained within required tolerances in plutonium buildings. The major portions of work under this project will be in Buildings 371, 559, 702, 707, 712, 750, 771, 776/777, and 779.

Net Federal total estimated cost (TEC)		$ 56,353

2242

10. Method of Performance

Titles I and II engineering and design, and Title III inspection will be performed by an Architect-Engineering firm working under contact with the Operation Contractor, or by the Operation Contractor.

Construction will be performed by contractors working under fixed-price, competitively bid contracts with the operating contractor.

Note: High Engineering, Design and Inspection (ED&I) percentage is driven by sunk costs for designing the originally planned underground distribution system and sunk costs for the design of Electrical Rehabilitation, which has been canceled.

All costs were escalated using the "Anticipated Economic Escalation Rates for DOE Construction Projects" developed by the Independent Cost Estimating (ICE) staff and updated in August 1993. All costs were escalated to the midpoint of the activity.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
(a) Line item--This represents normal engineering design, procurement, construction, and inspection of utility and construction projects of this size, range, and complexity.
(b) Expense-funded equipment--None.
(c) Inventories--None.
2. Other project costs
(a) R&D necessary to complete construction--None.
(b) Conceptual design--$783,000. Predecisional costs include preparation and revision of the Conceptual Design Report in prior years.
(c) Decontamination and decommissioning (D&D)--None.
(d) NEPA documentation costs--None.
(e) Other project-related costs--$1,578,000. Other project funding includes design criteria development, SARs, validation presentations, A/E selection, start-up testing, spare parts and O&M manuals.
(f) Non-Federal contribution--None.

b. Related annual funding
None.

13. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, OMB Circulars, Federal Property Management Regulations, and DOE orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6. {If applicable} The project will be located in an area not subject to flooding determined in accordance with Executive Order 11988. {If applicable} DOE has reviewed the GSA inventory of Federal Scientific laboratories and found insufficient space available, as reported by the GSA inventory.

14. Supplemental Project Data for Facility Utilization

This project does not include the construction of new buildings or building additions.

* Appropriated as construction funding.

a/ Revised to be consistent with submitted DOE HQ Baseline Change Proposal (BCP) 94-106-RF-M.
b/ Adjustments reflect the funding that remained in Defense Programs (DP) after the DP and Environmental Management Memorandum of Agreement dated August 27, 1993. DP transferred responsibility for the project to Environmental Management in FY 1992.
c/ FY 1996 funding level reflects a revision funding to the scope to support the Rocky Flats Special Nuclear Materials (SNM) consolidation initiative.
d/ The increased costs for the MSSA Nuclear Material accountability results from revised estimates from the DOE Oakland Operations Office for the DOE complex standardized (SNM) stabilization and packaging system.

2247

1. Title and Location of Project:	Master Safeguards and Security Agreement/ Material Surveillance Task Force Security Upgrades, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-125 2b. Operating Expense Funded	ADS# RF-6757

8. Project Description, Justification and Scope

The revised Master Safeguards and Security Agreement (MSSA) line-item contains 38 sub-projects which will increase the security and safety of Special Nuclear Materials (SNM), vital equipment, classified matter, and government property at the Rocky Flats Plant (Golden, Colorado) in accordance with the 1987 MSSA. The subproject work scope of the MSSA Construction Line-Item (CLI) has been significantly updated to include new subprojects of higher Safeguards & Security (S&S) programmatic priority whose scope-of-work is consistent with the intent of the MSSA document published in 1987. Of the 41 subprojects on the combined priority list, current MSSA funding profiles are estimated to fund only the top 28 priority subprojects. Unfunded MSSA subprojects primarily represent projects that either required further site mission definition or rely on technology that is not currently available on a "production" basis. The remainder of the subprojects on the combined list are currently under consideration for alternate funding.

These projects respond to DOE Order 5630.13 which requires each facility with SNM in their charge to review their Safeguards and Security Systems for potential vulnerabilities. This review was performed in two parts by the Master Safeguards and Security Agreement and an earlier review of the 707 Manufacturing Building by a Materials Surveillance Task Force (MSTF). The findings and recommendations of both efforts are documented in the MSSA report, dated September 1987.

The Safeguards and Security System used at Rocky Flats Plant can be discussed in terms of successive layers of protection for each of the buildings which contain SNM. Each protective layer is fitted with various types of electronic equipment, alarm detectors, alarm assessment and surveillance systems, physical barriers, and administrative controls to ensure that no unauthorized to SNM or classified information is possible. Security systems cannot typically be viewed merely as an accumulation of distinct and separate components. Rather, there is a synergistic quality to the measure of a security system's effectiveness, where the whole system is somewhat more than its parts. Evaluations or judgements of a particular component's worth on its own are not indicative of its true value to the system, and are therefore deceiving. Systems must be measured as a whole or in large segments to ensure that accurate conclusions are reached. Factors such as physical location, interaction with other components, communications, inherent strengths and weaknesses make the true value of a security system a complementary program. Decisions to change the scope of any portion of this project should be considered carefully before being implemented in order to determine the impact upon the entire system. Efficiency must be consider as well. The consolidation and repackaging of SNM will reduce requirements for detection, assessment, delay, interruption, and neutralization allowing great resource savings.

2248

1. Title and Location of Project:	Master Safeguards and Security Agreement/ Material Surveillance Task Force Security Upgrades, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-125 2b. Operating Expense Funded	ADS# RF-6757

8. Project Description, Justification and Scope (continued)

All safeguards and security systems consist of five basic components: detection, assessment, delay, interruption, and neutralization. Detection is simply the ability to discover intrusion or other unauthorized acts. Assessment is the ability to accurately recognize a detection event and determine the cause for it. Delay refers to physical impediments such as fences and walls to increase the adversary task time. Interruption is the act of disturbing the adversary action, forcing a response. Neutralization is the defeat of the adversary. Detection and assessment usually rely heavily on automated systems, such as intrusion detection and Closed-Circuit Television surveillance systems, whereas interruption and neutralization are almost exclusively the domain of the Protective Force. Delay systems are generally passive installations of barriers. All five elements are vital; loss or degradation of one seriously jeopardizes the ability to ensure protection of assets. The tasks within this project will enhance all of these functions, resulting in a balanced and effective system.

These basic components are represented in this Construction Line-Item by five functional groups of MSSA Line Item subprojects. These functional groups are defined below. All five components (functional groups) are vital; loss or degradation of one component may seriously jeopardize the ability of the overall system to ensure protection of assets. Each subproject of the MSSA CLI will enhance one or more of these components, resulting in a balanced and effective system.

Group	Task Title	Brief Description
(1)	Alarms and Alarms Support System	The tasks in this group relate to all facets of the alarm system, from initiation of an alarm, through its transmission and processing, to annunciation, along with the equipment and facilities necessary to support those functions.
(2)	Protective Force Support	The Tasks within this category pertain to the enhancement of the Protective Force. Ensuring that the response to security emergencies is both timely and effective requires that the Protective Force be physically conditioned, well trained, and properly equipped. These requirements, in turn, impose further needs for storage space and ancillary equipment.

2249

8. Project Description, Justification and Scope (continued)

(3)	Nuclear Material Accountability Systems	Accountability systems are used to determine the SNM content of packages in a wide variety of applications, ranging from holdup in glovebox exhaust plenums to off-site shipments and receipts. The highly specialized and technology intensive nature of SNM assay, along with the stringent accountability requirements imposed by DOE Order 5633.3, necessitates the utilization of a large number of job-specific accountability systems, in addition to a broad range of support equipment. The tasks in this grouping reflect this need.
(4)	Physical Protection	Physical protection generally refers to increasing the amount of time it takes to make unauthorized physical access to an asset repository. By doing this, the protective force is given more time to respond and Technical Surveillance Countermeasures in an effective manner, thereby decreasing the opportunity for an adversary(s) to accomplish their objective. Physical protection tasks are typically passive installations of barriers or obstacles designed to be penetration- or bypass-resistant. In addition to the physical protection tasks in this grouping, there is also a task to support TSCM operations.
(5)	Access Control	Access control involves the screening of personnel and packages entering security areas to ensure that the personnel are authorized to enter the area and that no contraband is introduced. The DOE Orders mandate certain personnel identification verification and package inspection criteria for the screening process at each security level, and the tasks within this grouping support these requirements.

Weapons grade SNM is the only missing ingredient to unclassified public production of a nuclear weapon. In addition to the substantial collections of Category I quantities of SNM in storage at Rocky Flats, there are also completed weapons components. It is unquestionable that these assets must be afforded a high level of protection from theft and other acts detrimental to national security interests. The consequences of a successful acquisition of nuclear assets by a terrorist organization or other group are considered unacceptable.

The FY 1997 appropriation will continue construction of the nuclear material accountability system, procurement of hold-up measurement equipment, and continuation of Building 371 upgrades for consolidation.

j. Non-Federal contribution.		0
Net Federal total estimated cost (TEC)		$ 41,300

Note: Revised to be consistent with Rocky Flats Office (RFO) BCP 94-106-RF-M, and approved FY 1994 Rocky Flats Plant (RFP) Work Package (WP) 74301.

1. Title and Location of Project:	Master Safeguards and Security Agreement/ Material Surveillance Task Force Security Upgrades, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-125 2b. Operating Expense Funded	ADS# RF-6757

10. Method of Performance

Due to the subproject nature of this Line Item and the mission transition at Rocky Flats Plant, this Line Item has been structured to facilitate subproject scope adjustments that make economic sense against evolving transition needs which affect Safeguards and Security issues. The Key Decision (KD) process will be used on each discrete subproject to validate subproject scope, schedule, and cost prior to the commitment of capital funds to the subproject.

A Project Team will be established to fully plan the MSSA CLI, establish major task Statement-of-Work, and perform engineering work, (Titles I through III Engineering) through a combination of in-house design expertise and by using the services of Architect/Engineering (A/E) firms. When determined to be cost and schedule effective, subproject designs, for Titles I through III Engineering, will be accomplished by using Fixed Price Contracting for discrete subproject statements-of-work where ever possible. It is anticipated that requirements for Architect Engineering services will be supplied by the placement of Task Orders against Master Task Subcontracts (MTS) or, the placement of individual subcontracts as deemed appropriate by procurement with concurrence of the Project Manager.

1. Title and Location of Project:	Master Safeguards and Security Agreement/ Material Surveillance Task Force Security Upgrades, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-125 2b. Operating Expense Funded	ADS# RF-6757

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs
      (a) Line item--Construction line item will provide to upgrade protection measures.
      (b) Expense-funded equipment--No operating expense funded equipment will be purchased for this project.
      (c) Inventories--No current inventories will be used for this project.
   2. Other project costs
      (a) R&D necessary to complete construction--No R&D will be required for this project.
      (b) Conceptual design--Conceptual design report has been prepared. The need for revisions to this document are being discussed with DOE RFO to include expanded scope for SNM Consolidation. An enhanced Design Criteria will also be prepared for SNM Consolidation.
      (c) Decontamination and decommissioning (D&D)--None.
      (d) NEPA documentation costs--None.
      (e) Other project related costs--Other project related costs include Safety Analysis Reports, Construction project data sheets preparation and project validation, development of design criteria, operational readiness review training, and preparation of operation and maintenance manuals.
      (f) Non-Federal contribution--None.

b. Related annual funding
   None.

2254

1. Title and Location of Project:	Master Safeguards and Security Agreement/ Material Surveillance Task Force Security Upgrades, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-125 2b. Operating Expense Funded	ADS# RF-6757

13. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, OMB Circulars, Federal Property Management Regulations, and DOE orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6. {If applicable} The project will be located in an area not subject to flooding determined in accordance with Executive Order 11988. {If applicable} DOE has reviewed the GSA inventory of Federal Scientific laboratories and found insufficient space available, as reported by the GSA inventory.

(SITE STABILIZATION)
(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and Location of Project: Residue Elimination Project, Rocky Flats Plant, Golden, Colorado

2a. Project No.: 96-D-468 ADS# RF-6723
2b. Operating Expense Funded

3a. Date A-E Work Initiated: 1st Qtr. FY 1996

3b. A-E Work Duration: 8 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- None
Total Project Cost (TPC) -- None

4a. Date Physical Construction Starts: 2nd Qtr. FY 1996

4b. Date Construction Ends: 1st Qtr. FY 1998

6. Current Cost Estimate:
TEC -- $62,400
TPC -- $87,100

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1996 *	$ 33,100	0	$ 33,100	$ 33,100
1997	25,500	0	25,500	25,500
1998	3,800	0	3,800	3,800
1999	0	0	0	0

8. Project Description, Justification and Scope

The residues which were previously generated as a result of plutonium manufacturing operations at Rocky Flats were packaged for a brief period of storage (less than 3 years) to await processing for plutonium recovery. Since the shut down of plutonium operations at Rocky Flats in 1989, these materials have been stored in temporary storage packaging. The chemical and physical forms and packaging configurations of these residue materials are known to be unsafe for extended storage, and represent a significant liability which must be reduced. On May 26, 1994, the Defense Nuclear Facilities Safety Board (DNFSB) issued its Recommendation 94-1. In this recommendation, the DNFSB found that: "Thousands of containers at the Rocky Flats Plant hold miscellaneous plutonium-bearing materials classified as "residuals," some of which are chemically unstable. Many of the containers of plutonium metal also contain plastic, and in some cases at the Rocky Flats Plant, the plastic is believed to be in contact with the plutonium. It is well known that plutonium in contact with plastic can cause formation of hydrogen gas and Pyrophoric plutonium compounds leading to a high probability of plutonium fires."

* Appropriated as construction funding

8. Project Description, Justification and Scope (continued)

The Site Integrated Program Plan (SIPP), the response to the residue concerns raised by both the DNFSB Recommendation 94-1, depends upon these projects to resolve these most pressing residue safety concerns. Higher risk residues must be treated by May 1997, and lesser risk residues by May 2002.

The timely treatment and elimination of residues at Rocky Flats has been further mandated by the Residue Compliance Agreement between DOE and the State of Colorado (Settlement Agreement and Compliance Order on Consent No. 89-10-30-01, and by Compliance Order 93-04-23-01) which requires DOE to establish the Mixed Residue Reduction Program (MRRP) and requires DOE and EG&G to "Timely and Adequately implement the MRRP" by (1) "The processing of backlog mixed residues to put them in a shippable and/or disposable form as expeditiously as reasonably possible," and (2) "Removal from the plant of the backlog mixed residues and the TRU mixed wastes generated by their processing as expeditiously as reasonably possible once a final off-site disposal facility becomes available." Approximately 65 percent of the residues to be treated by these projects are categorized as mixed and are regulated.

This project will provide the capability to treat residues so they can be stored safely onsite for a period of up to 50 years, and so they can be stored and readily prepared for shipment to the Waste Isolation Plant or other repository when it becomes available. The subprojects are, (1) Salt Residue Stabilization and Repack, (2) Combustible Residue Stabilization and Repack, (3) Ash Residue Stabilization and Repack, and (4) Wet Residue Stabilization and Repack.

a. Subproject 01 - Salt Residue Stabilization and Repack

TEC	Previous	FY 1997	Outyears	Construction Start - Completion Dates
$ 18,500	$ 17,800	$ 700	$ 0	3rd Qtr. FY 1996 - 2nd Qtr. FY 1997

This subproject will be constructed in Building 707 and will utilize existing gloveboxes and new furnace systems, associated Non-Destructive Assay (NDA) equipment and associated handling equipment. It will include use of some existing equipment, but will require structural modifications and new off-gas systems. Stabilization will be conducted via oxidation of salt in the molten state, with subsequent repackaging into metal containers. Oxidation will convert the elemental metals to their corresponding oxides, chlorides, and oxichlorides. Any hydrides or peroxides that might be present will also be converted to inert compounds. The oxidized salts will be placed in metal cans which will be welded shut and subsequently packaged into drums. The project will occupy one and one half modules in Building 707, with dedicated rooms for drum storage, NDA equipment, and drum unpacking. Special consideration must be given to design of worker protection for high radiation salt handling. FY 1997 funding will be used for Title I and II engineering project management, Title III engineering, government furnished equipment (GFE) procurements, construction, construction management, demolition and removal, and final safety analysis. FY97 funding will be used to complete construction, and to enhance interim storage.

2257

8. Project Description, Justification and Scope (continued)

b. Subproject 02 - Wet/Combustible Residue Stabilization and Repack

TEC	Previous	FY 1997	Outyears	Construction Start - Completion Dates
$ 19,100	$ 4,700	$ 14,300	$ 0	4th Qtr. FY 1996 - 3rd Qtr. FY 1997

Several treatments will be in parallel, including washing/rinsing, and thermal desorption. Plans are to install the capabilities in Building 776. Non-Destructive Assay and handling equipment will be required. Existing equipment will be used for the glove box line, with new equipment. The layout will be based upon the existing layout, and the facility will be upgraded to meet current standards. Support systems will be upgraded to meet requirements. FY97 funding will be used to complete construction, and enhance interim storage.

c. Subproject 03 - Ash and Dry Residue Stabilization and Repack

TEC	Previous	FY 1997	Outyears	Construction Start - Completion Dates
$ 14,500	$9,400	$ 5,100	$ 0	3rd Qtr. FY 1996 - 3rd Qtr. FY 1997

This system to treat and package ash and other particulate residues will be installed in Modules D and E within Building 707. The facility resulting from the project will be supported by the existing building vital safety systems (VSS), building utility systems and building personnel support systems. New processing equipment will for the most part be installed in existing gloveboxes. In some cases, existing gloveboxes and equipment will be removed to provide space for new processing equipment. The ash processing system will utilize the downdraft tables and output of feed and product materials. It will utilize the conveyor glovebox in Module E for material movement. The existing welders will not be required and will be removed to provide space treatment, Non-Destructive Assay, and packaging equipment. FY 1997 funding will be used for Title III engineering, construction, and enhancement of interim storage.

22528

1. Title and Location of Project:	Residue Elimination Project, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 96-D-468 2b. Operating Expense Funded	ADS# RF-6723

8. Project Description, Justification and Scope (continued)

d. Subproject 04 - Classified shares and interim storage system

TEC	Previous	FY 1997	Outyears	Construction Start - Completion Dates
$ 10,300	$1,200	$5,400	$3,700	4th Qtr. FY 1996 - 1st Qtr. FY 1998

This project includes constructing a capability in B-707 to destroy residues with classified shares, stabilize, and immobilize/repact. It also includes construction of interim storage capabilities within existing facilities as necessary. FY97 funding will be used to complete construction of this treatment facility.

2259

1. Title and Location of Project:	Residue Elimination Project, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 96-D-468 2b. Operating Expense Funded	ADS# RF-6723

9. Details of Cost Estimate

	Unit Cost	Item Cost	Total Cost
a. Design and management costs			$ 15,000
1. Engineering design and inspection at approximately 25 percent of construction costs, Item c		$ 7,360	
2. Construction management at 14 percent of construction cost, Item c		4,100	
3. Project management at 12 percent of construction costs, Item c		3,540	
b. Land and land rights			0
c. Construction costs			29,300
1. Improvements to land		0	
2. Buildings		0	
3. Other structures		0	
4. Utilities		0	
5. Special facilities		29,300	
(a) Special Facilities Equipment	$ 13,210		
(b) Special Facilities Installation	16,090		
d. Standard equipment (not applicable for design only request)			0
e. Major computer items			0
f. Removal cost less salvage			3,900
g. Design and project liaison, testing, checkout, and acceptance			0
Subtotal			$ 48,200
h. Contingency at approximately 29 percent of above costs			14,200
i. Total line item cost (Section 12.a.1.(a))			$ 62,400
j. Non-Federal contribution			0
Net Federal total estimated cost (TEC)			$ 62,400

2260

1. Title and Location of Project:	Residue Elimination Project, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 96-D-468	ADS# RF-6723
		2b. Operating Expense Funded	

10. Method of Performance

- The Rocky Flats Environmental Technology Site Integrating Contractor will provide project management services.
- Long lead time equipment will be procured by the Integrating Contractor, all standard items will be procured by the construction contractor.
- Architect-Engineer services will be performed by subcontracted A-E services.
- Construction will be via contract.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1997	FY 1998	FY 1999	Total
a. Total project costs					
1. Total facility costs					
(a) Line item (Section 10.i.) (design only)	$ 33,000	$ 25,500	$ 3,800	$ 0	$ 62,400

(c) Decontamination and decommissioning (D&D)	0	0	0	0	0
(d) NEPA documentation costs	500	0	0	0	500
(e) Other project-related costs	7,449	13,607	325	0	21,381
Total other project costs	$ 10,768	$ 13,607	$ 325	$ 0	$ 24,700
Total project cost	$ 43,868	$ 39,107	$ 4,125	$ 0	$ 87,100
(f) Non-Federal contribution	0	0	0	0	0
(g) Net Federal total project cost (TPC)	$ 43,868	$ 39,107	$ 4,125	$ 0	$ 87,100

2261

11. Schedule of Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding (estimated life of project--20 years)

1. Facility operating costs (included in total building costs)	$ N/A
2. Facility maintenance and repair costs (included in total building costs)	N/A
3. Programmatic operating expenses directly related to the facility	45,600
4. Capital equipment not related to construction but related to the programmatic effort in the facility	0
5. GPP or other construction related to programmatic effort in the facility	0
6. Utility costs (included in total building costs)	N/A
7. Other costs (included in item 3)	N/A
Total related annual funding	45,600

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item--Project construction line item funding will include costs for disposal of existing equipment as identified.
   (b) Expense-funded equipment--There is no operating expense funded equipment being purchased for this project. No PE&D funds will be allocated for these projects.
   (c) Inventories--Maximum use of existing equipment and material will be made to reduce cost; no inventory cost is expected.
2. Other project costs
   (a) The costs for development projects and various studies to provide information for project concept and technical criteria are estimated to be $880,000.
   (b) Conceptual design--The conceptual design for this project will be finalized via advanced Conceptual Design.
   (c) Other project-related costs include performance of system operations testing, cost of D&D waste disposal, final start up of each project, operating spares, operating and maintenance manual development, new production supplies such as glovebox gloves, tools, etc.
3. Other related funding requirements
   (a) Facility operating costs cannot be determined since they will be included in total building costs.
   (b) Programmatic operating expenses include program management and preparation of the design criteria before project funds are available, coordination of facility upgrade and maintenance requirements, and coordination of process definition.
   (c) There is no expense-funded equipment envisioned for this.
   (d) No current inventories will be used on this project.
   (e) No cost estimate for production operation is included in item 12b (3).

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding

1. These costs have been estimated and included in total as programmatic operating expenses.

13. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

2002	2,400	0	2,400	2,900

* Appropriated as construction funding.

a/ The funding profile was extended to FY 2002 and will extend project completion date accordingly.
b/ Reflects funding remaining in Defense Programs (DP) after DP and EM's MOA dated 8/27/93, which transferred responsibility for the project to EM in FY 1992.

2265

1. Title and Location of Project:	Criticality Alarm and Plant Annunciation Utility Replacement, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 91-D-127 2b. Operating Expense Funded	ADS# RF-6756

8. Project Description, Justification and Scope

The project provides support and disseminates information for all inter-building data transmissions, communications, security, and safety functions on plant site.

The Criticality Alarm and Plant Annunciation System Upgrade (CAPASU) project will replace the deteriorated criticality alarm systems and plant annunciation systems at the Rocky Flats Environmental Technology Site (RFETS). The criticality alarm system will be installed in buildings that contain Category one, two, and three levels of plutonium. This new system will amplify and broadcast criticality alarm signals. This is needed to ensure worker safety during the consolidation of Special Nuclear Materials (SNM) and during environmental restoration (decontamination and decommissioning) of buildings that contain fissile material. The modifications to the plant annunciation system also termed the Life Safety\Disaster Warning system (LS\DW) will ensure worker safety by upgrading the presently failing LS/DW, which provides annunciation of alarms and the dissemination of information of information plant wide. As a part of supporting the upgrades to the plant wide LS/DW system, as well as other capital line item projects on site, the CAPASU project will also install a fiber optic communications network around the plant site.

Due to the change in the mission of Rocky Flats, the CAPASU project has been phased to account for the transition to the new mission. There ar five phases that make up the CAPASU project. The buildings in each phase were selected based on their future perceived mission. The buildings whose future mission has not yet finalized have been placed in phases 3 and 4. Once the building missions are determined, the need to upgrade the buildings each phase will be evaluated during the design portion of the phase.

Phase A - installs the fiber optic communication system around the plant site. The communications system is needed to support the criticality alarm system as well as other site projects such as the Plant Fire/Security System Replacement line item, the Master Safeguards and Security Agreement line item, and the Air Monitoring Improvement line item.

Phase 1 - Installs criticality alarms and upgrades the LS/DW systems in the buildings containing plutonium on site.
Phase 2 - Installs criticality alarms and upgrades the LS/DW systems in the main alarm stations and other support buildings on site.
Phase 3 - Installs criticality alarms and upgrades the LS/DW systems in the site support and manufacturing buildings on site.
Phase 4 - Installs criticality alarms and upgrades the LS/DW systems in the rest of the site support buildings.

2266

1. Title and Location of Project:	Criticality Alarm and Plant Annunciation Utility Replacement, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 91-D-127 2b. Operating Expense Funded	ADS# RF-6756

8. Project Description, Justification and Scope (continued)

The Plant Annunciation Utility is the primary means of informing plant personnel when immediate announcements are required concerning production, security, radiation contamination, weather, or emergency situations such as fire or terrorist actions. The existing Plant Annunciation Utility is worn, failing, and inadequate to meet current production requirements and industry standards. The utility is also used to satisfy Department of Energy Order 5480.5 that requires a system in all buildings where fissile materials are handled to broadcast alarms in the event of a criticality accident. Without functioning criticality alarm systems in these buildings, production operations are stopped.

There are currently 54 documented failures (1976 - present). Out-of-service time results in periods of unsupervised system operation. Documented failures include: a) 25 failures with evacuation (400 people at 2 hours each per failure), total cost of lost time nearly $1.4 million; b) 29 failures without evacuation, 7 with duration of up to 30 days and 5 with duration of up to 36 hours, 17 with unknown duration.

From 1990 through February 1993, approximately $8.5 million (M) has been spent to maintain the existing system. A backlog of $8.3M worth of maintenance and repair (M&R) work requests has accumulated over the same time period. If resources were available, the cost to maintain the systems would have exceeded $16.8M. At the current maintenance and repair rate of increase, cost to maintain are estimated to range from $3M to $5M during FY 1996. Current compensatory measures require over 2,000 hours/month at an annual cost exceeding $2.6M (in addition to M&R costs). The purpose of the fiber optic network portion of the CAPASU project is to provide a fiber optic cable infrastructure transport facility for several vital worker safety systems and for applications groups to implement various data and voice communications applications on a plant wide basis.

The existing communication networks cannot meet the communication requirements of currently identified applications for the following reasons:

1. The triax network which would support the plant wide fire and security system on plant site to be installed by the Plant Fire and Security System Replacement project is over fourteen years old, infiltrated by water in several locations, subject to lighting induced failures, and not reliable. Repairs in some locations are extremely difficult and cost prohibitive.

2. The twisted pair phone line around plant site cannot handle the capacity requirements of the combined fire, security, Closed-Circuit Television (CCTV), Nondestructive Assay (NDA) Local Area Network (LAN), criticality alarm, and Life Safety/Disaster Warning (LS/DW) upgrades. CCTV and NDA Lan are scheduled to be ready for communication during 1995.

3. The broadband is anticipated to be saturated by 1995 and 1996. Ungerman/Bass will not provide parts for the broadband system used for data applications after 1995. After 1999 neither parts nor services will be available by Ungerman/Bass. By 1999, the upgrades to fire, security, LS/DW, and Criticality Alarms will be completed. Per current information, the existing data communication network will be at the end of its service life at the time of the turnover to the upgrades systems. This would preclude the broadband as a logical and dependable means of communications for worker vital safety systems and protection (security) of Special Nuclear Material.

Net Federal total estimated cost (TEC)		$ 29,500

Note: Estimate based on March 1992 Phase A Title I estimate of Phases I-4 Conceptual Design Report estimate.

All costs were escalated using the "Anticipated Economic Escalation Rates for DOE Construction Projects" provided by the Department of Energy, Headquarters, Office of Infrastructure Acquisition, and updated in August 1994. All costs were escalated to the midpoint of the activity.

2268

1. Title and Location of Project:	Criticality Alarm and Plant Annunciation Utility Replacement, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 91-D-127 2b. Operating Expense Funded	ADS# RF-6756

10. Method of Performance

Titles I and II Design Engineering will be performed by an Architect-Engineer (A-E) working under a prime, negotiated fixed-price contract with the Operating Contractor. The design and construction of portions of this project are scheduled to be completed in phases. Construction of portions of this project will be performed by a fixed-price fixed-rate A/E Contract. Inspections and construction coordination will be performed by the Operating Contractor.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	Total

13. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, OMB Circulars, Federal Property Management Regulations, and DOE orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6. {If applicable} The project will be located in an area not subject to flooding determined in accordance with Executive Order 11988. {If applicable} DOE has reviewed the GSA inventory of Federal Scientific laboratories and found insufficient space available, as reported by the GSA inventory.

1998	13,300	0	13,300	13,300
1999	15,340	0	15,340	15,340
2000	7,360	0	7,360	7,360

* Appropriated as construction funding.

a/ This project was originally funded under Defense Programs. Upon transfer of the project to Environmental Management a Memorandum of Agreement was signed allowing Defense Programs to retain the funding for FY 1992 ($5,200,000) and a portion of the funding for FY 1993 ($3,800,000). This resulted in a two year delay, causing the project to be restructured with a completion date of FY 2000.
b/ Reprogramming to comply with current DOE Orders and Fire Protection Association Codes.

2273

1. Title and Location of Project:	Plant Fire/Security Alarm System Replacement, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-123 2b. Operating Expense Funded	ADS# RF-6755

8. Project Description, Justification and Scope

The new plant-wide alarm system is configured with a Central Alarm Station in Building 121, a Secondary Alarm Station in Building 765, or an alternate location in an existing facility and a Fire Alarm Station in Building 331. The Central Alarm Station will have a Central Processing Computer with console monitors, keyboards, and printers to supervise operation of the fire and security alarm systems throughout the plant. The Secondary Alarm Station will have identical equipment and will control the fire and security alarms in the event of failure of the Central Alarm Station. The Fire Alarm Station will have a console with monitors, keyboards, and printers with the capability of monitoring and controlling only fire alarm systems. The monitoring and control equipment in the Fire Alarm Station will be driven by either the Central or Secondary Alarm Stations, whichever is controlling the system at the time.

Multiplexed panels will be distributed throughout the plant at 13 main building locations (Central Alarm Building 121, Fire Station Building 331, Plutonium Recovery Building 371/374, Uranium/Beryllium Manufacturing Building 444, Plutonium Analytical Laboratory Building 559, Plutonium Manufacturing Building 707, Plutonium Manufacturing Building 771, Plutonium Manufacturing and Disassembly Building 776/777, Plutonium Development Building 779, Central Computing Facility Building 881, Uranium Processing Facility Building 883, and the Plutonium Product Warehouse Building 991). Alarm coverage within respective buildings will be zoned such that loss of a single multiplexed panel will not affect the entire system within the building.

Security alarm functions to be provided by the replacement system include perimeter, zone, and volumetric intrusion detection, and plant-wide security system tamper and system integrity monitoring. The new system will provide identification and annunciation of all individual security sensors allowing efficient and expedient assessment and response to alarms. The security alarm system to be utilized will be the ARGUS System developed by the Lawrence Livermore National Laboratory.

The new system will implement automated personnel access control throughout the controlled areas of the plant. Portal access control devices will include magnetic stripe and card readers, biometric devices, and access booths. The system will maintain a database on all enrolled personnel controlling access at each portal depending on date, time of day and requirements for the Two Person Rule. Enrollment will be accomplished at permanent enrollment stations in Buildings T120 and 131 or by a portable unit normally located at Building 762A. The access control capabilities of the ARGUS System will be utilized and integrated with the current Rocky Flats Plant (RFP) hardware configuration.

2274

8. Project Description, Justification and Scope (continued)

Fire alarm system functions include heat and smoke detection in rooms, gloveboxes, and filter plenums and fire phone systems in process buildings and outdoor plant-site locations. Fire detector types installed as part of this project include heat detectors, smoke detectors, sprinkler flow detectors, plenum flow detectors, Halon, dry chemical and Carbon Dioxide (CO_2) release, and manual pull stations. Reconfiguration of PA will reduce the existing PA to enclose only the Building 371 complex by constructing a fence line east of the building. This fence will tie into existing PA perimeter northeast and southeast of the building, and this new perimeter will be the new PA. New construction will include, but not limited to, an isolation zone with detection zone, a new access point, and a patrol road. The new fence and associated systems will be fully integrated and compatible with existing and planned systems for current PA perimeter.

PURPOSE

The purpose of this project is to replace the existing security and fire alarm systems with a modern, efficient, high reliability, cost-effective system. Components of the current RFP alarm system which meet fire and security requirements will not be replaced, and will be integrated into the new alarm system. The new system will provide a level of autonomy, efficiency, and overall performance that will greatly reduce the manpower intensive compensatory measures, frequent inspections and walk tests that characterize the current system. It will annunciate both fire and security alarms to the initiating device. This will improve the response time and efficiency of assessment/alarm response and, at the same time, enhance overall security by eliminating the ambiguities inherent in the current system. in addition, this project will reduce the enclosed area of the current PA by approximately 80 percent. This will increase autonomy, efficiency, and overall performance of the security alarm system, and it will allow the realization of substantial and recurring cost savings as part of the Special Nuclear Materials (SNM) Consolidation program. It is estimated that the payback period for the fire and security alarm upgrades is 3.1 years. The estimated payback period for the PA reduction is 1 year.

JUSTIFICATION

The existing fire and security system is outdated, requires intensive man-hour effort to operate, and is very expensive/difficult to maintain. The current system is not in compliance with DOE Orders 5632.2A, 5632.5, 6430.1A, requirements called out in the "Standards and Criteria", NFPA-71, and NFPA-72. It has grown far beyond its original design capacity and intended initiating device count. It the process, the ability to annunciate individual devices has, in many cases, been lost. In some areas, dozens of devices are "paralleled" such that they report as a single alarm. The result is that instead of checking only the individual device that alarmed, security forces are required to check, one at a time, all the devices tied together as a single alarm. Besides being inefficient and expensive, this increases the time required for complete assessment and allows more options/possibilities for surreptitious activities

2275

8. Project Description, Justification and Scope (continued)

System components, many of them manufactured in the 1950's and 1960's, are well beyond their useful lifetimes, and as a result, failures are occurring at an increasingly high rate. On several major system components, the original equipment manufacturers no longer support or service the equipment. This results in inordinate costs, efforts, delays in equipment maintenance and repair. Due to the age of the system and the inability to properly maintain it, the reliability of the overall system is questionable. Many system failures have occurred at an increasing rate in the last year which can result in risking Life Safety and Government Assets.

The schedule is based on awarding multiple construction bid sets. The benefit of this approach is to start construction sooner than would be possible if only a single construction package were issued. The Plant Fire/Security System Replacement (PFSR) project has been phased to coincide with the RFP Transition Plan. Each phase of the project is tied to a specific "Group" of buildings as defined in the Transition Plan. Each project phase is scheduled with an independent set of Key Decision points to allow potential scope change decisions to occur based on transition input.

The PFSR phases are defined as follows:

- Phase A involves the development of the core system, CAS/SAS upgrades, and buildings required for the current RFP mission (Building 371, 881, 559, 707, and buildings and facilities used for engineering, fire protection, maintenance, warehousing, utilities, personnel services and training, administration, and other support services). Buildings 371, 559, 707, and 881 are buildings designated as facilities critical to the projected Transition mission at RFP, and as such, will be upgraded as necessary to support this mission. Buildings 559 and 707 have recently undergone significant upgrades as a result of Operational Readiness Reviews (ORR) and OSE Safeguards and Security inspections. Due to this fact, it is anticipated that required upgrades within these facilities will be minimal. Additionally, while building 776/777 has been declared a surplus facility by the RFP Transition organization, activities related to size reduction must be maintained per the RFP Transition Plan. therefore, building 776/777 will be upgraded as necessary during Phase A to support the size reduction activities, however, the remainder of the building will be treated as a surplus facility within Phase D.

General comments regarding Project 92-D-123, Fire Protection within Plutonium Buildings

- Phase B involves buildings used for waste management (Buildings 374, 664 and 774).

- Phase C involves buildings now used in non-plutonium production and expected to be declared surplus in the future (Buildings 440, 444, 460, 865 and 883).

2276

1. Title and Location of Project:	Plant Fire/Security Alarm System Replacement, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-123 2b. Operating Expense Funded	ADS# RF-6755

8. Project Description, Justification and Scope (continued)

- o Phase D involves surplus buildings previously used in plutonium production. The current schedule has these buildings transitioning to waste operations status with SNM removed (Buildings 771, 776/777, 779, 886 and 991)

- o Phase E will involve reconfiguration of the PA, by reducing the enclosed area to the Building 371 complex. This is central to the SNM Consolidation program, and will allow the realization of substantial cost savings through the reduction and streamlining of protection efforts.

The first phase will include the installation of the computer equipment and software associated with the central and secondary monitoring stations, and installation of the node multiplex panels, All phases will include replacement of local fire and security system detectors, devices, and panels, and interface of these devices to the new system multiplex panels in the above buildings.

This priority approach to the phases of the PFSR Project will ensure that facilities whose mission is changing and whose alarm monitoring needs will be greatly reduced through the transition, will be modified last, eliminated unnecessary installation of fire and security alarm systems. Phases A and B are not currently affected by the RFP mission change, and Phases C and D scope will be further evaluated at specific Key decision points based on future Transition Plan details.

Scheduled work for the planning year (FY 1997) includes the following:

- o Phase A construction and equipment procurement will be completed.
- o Equipment procurement and the core system installation will be completed.
- o PA Reconfiguration design will be initiated.

2977

1. Title and Location of Project:	Plant Fire/Security Alarm System Replacement, Rocky Flats Plant, Golden, Colorado	2a. Project No.: 92-D-123 2b. Operating Expense Funded	ADS# RF-6755

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and management costs		$ 20,500
1. Engineering design and inspection at approximately 26 percent of construction costs, Item c	7,220	
2. Construction management costs are approximately 22 percent of construction costs (c, d, e, and f)	6,290	
3. Project management at 26 percent of construction costs (Item c)	6,990	
b. Land and land rights		0
c. Construction costs		27,370
1. Improvements to land	5,730	
2. Buildings	4,690	
3. Other structures	0	
4. Utilities	0	
5. Special facilities	16,970	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		3,910
g. Design and project liaison, testing, checkout and acceptance.		0
Subtotal.		$ 51,800
h. Contingency at approximately 21 percent of above costs		11,100
i. Total line item cost (Section 12.a.1.(a))		$ 62,900
j. Non-Federal contribution		0
Net Federal total estimated cost (TEC)		$ 62,900

Note: This estimate based on scope information provided by Engineering, Users estimates and a Conceptual Design Report estimate performed under the Basic Ordering Agreement. Hours estimates were provided by Engineering, Project Management and Construction Management.

All costs were escalated using the "Anticipated Economic Escalation Rates for DOE Construction Projects" provided by the Department of Energy, Program/Project Management Division, and updated in August 1994. All costs were escalated to the midpoint of the activity.

2278

10. Method of Performance

Title I and II Design Engineering will be performed by an Architect-Engineer (A-E) working under a prime, negotiated fixed-price contract with the Operating Contractor. The design and construction of portions of this project are scheduled to be complete in phases. Construction of portions of this project located within exclusion areas may be performed by the on-site Cost-Plus-Fixed-Fee Contractor. Construction will be performed by a contractor working under a prime negotiate fixed price contract with the Operating Contractor. Inspection and construction coordination will be performed by the Operating Contractor.

11. Schedule of Project Funding and Other Related Funding Requirements

1.	Title and location of project: Savannah River (SR) Site Environmental Restoration Savannah River, South Carolina	2a. Project No. D/ND-1.4.16	
		2b. Operating Expense Funded	

8. Project Description, Justification and Scope

The Savannah River Environmental Restoration Project is responsible for all aspects of assessment and remediation of facilities and sites that are no longer a part of active operations. The project is managed according to the following structure: 1) remedial actions (RAs), 2) decontamination and dismantlement (D&D), 3) surveillance and maintenance (S&M), and 4) program support. Remedial actions consist of activities required to assess and remediate surface waste sites and ground water. There are currently over 100 waste sites specifically identified to be remediated. Ground water is currently being remediated at the contaminated 3/700 Area. D&D consists of activities required to assess and decommission inactive facilities and structures. S&M consists of activities required to maintain waste sites after closure. The main closure sites currently being monitored are the M-Area Settling Basin and Lost Lake, the F/H Seepage Basins, the Mixed Waste Management Facility (MWMF), and the Metallurgical Lab Basin. Program support consists of crosscutting activities that are required to technically support the program and cannot be directly associated with one specific site or facility. For example, some program support activities are geoanalytical support, ground water modeling support, and human health/ecological risk assessment program support.

Budget Year Achievements

RA:
Continue ground water monitoring and sampling; begin assessment activities for R-Reactor, K-Reactor, seepage Basins and Coal Pile Runoff Basins; continue ground water assessment activities at the MWMF, Sanitary Landfill; continue assessment activities at the oil and chemical basins, separations basins, storage tanks, burning pits, rubble pits and piles, radioactive burial grounds, and 200 Area; continue characterization of the Burial Ground Complex and Silverton Road Waste site; continue field investigations and work plans in accordance with the Federal Facility Agreement (FFA); complete the Savannah River Technology Center (SRTC) Seepage Basin Closure; complete construction of SRTC and Vadose Zone ground water remediation project; continue operation of A/M Area Air Strippers.

D&D:
Facilities must meet EM-40 criteria before transfer. Continue current surveillance, maintenance and other activities at C. P. and R reactors.

The Heavy Water Component Test Reactor (HWCTR) facility was deactivated in 1963. Ancillary building and equipment were removed in 1994. National Environmental Policy Act documentation, asbestos removal and D&D planning will proceed in 1995. The deactivated reactor is currently scheduled for D&D. S&M activities will continue until completion of the D&D.

HWCTR is identified as a facility in the D&D facilities plan. It is currently in the S&M phase awaiting D&D.

Program Support:
Perform geoanalytical support; provide special SRTC environmental technical support; provide environmental risk assessment support; provide generic system engineering support; provide generic design engineering support; provide generic Environmental Restoration Department program management support; provide human health/ecological risk assessment program support.

1.	Title and location of project:	Savannah River (SR) Site Environmental Restoration Savannah River, South Carolina	2a. Project No. D/ND-1.4.16 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

S&M:

Continue S&M on closed waste sites.

Compliance Oversight:

Provide reimbursement to the State of South Carolina for Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) oversight activities and provide funding for Georgia and South Carolina Agreements-in-Principle.

The Activity Data Sheet (ADS) costs depicted below are operating expense funded construction activities for the Environmental Restoration program based upon the given target funding.

SRTC Seepage Basin: SR-501-AA

The unit consists of four unlined earthen basins located on 2.3 acres adjacent to the SRTC complex. The unit is located next to a main access route to the A/M-Area. The basins received low-level radioactive liquid waste from the SRTC laboratories from 1954 to 1982. FY 1996 activities include completing construction and post construction activities. Completing construction includes the completion of remaining construction field activities, field inspections, and follow-up and project turnover to Environmental Restoration. Post construction activities include Westinghouse Savannah River Company (WSRC) and DOE closure certification, PE closure certification, and submittal of closure certification to the South Carolina Department of Health and Environmental Control (SCDHEC). The post construction activities also include completion of certification reports, logs, survey plats, and as-built drawings and final turnover of the facility.

F&H Area Ground Water: SR-515-AA

A pump and treat system with reinjection of treated water has been selected for remediation. Recovery wells, located down-gradient from the basins in each area, will intercept the ground water. The recovered water will be transferred to a separate treatment unit in each (F&H) area. Each unit will be designed to treat approximately 150 gpm. The currently favored treatment technology is neutralization to precipitate both heavy metals and radionuclide metals. The precipitate will be removed from the ground water by settling and filtration. After treatment, the water will be reinjected upgradient of the basins. Tritium and nitrates are not removed by the Phase I treatment system. However, reinjection allows time for the tritium to decay before the ground water outcrops to the seepline. Surface enhancements, such as contouring and planting of selected vegetation, will be used as a supplemental means of reducing infiltration and improving hydraulic control over the contaminant plumes. Required well sampling and analysis will continue during the assessment phase of the project.

2285

1. Title and location of project:	Savannah River (SR) Site Environmental Restoration Savannah River, South Carolina	2a. Project No. D/ND-1.4.16 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

L-Area Oil/Chemical Basin: SR-504-AA

The L-Area Oil and Chemical Basin operated from 1961 to 1979, and is approximately 75 feet wide and 120 feet long. Liquid wastes received by the basin were sourced from the L-Area Hot Shop via an underground pipeline, and from other reactor areas via 55-gallon drums and tanker trucks. Liquid wastes consisted of degreasing solvents. FY 1996 activities include Feasibility Study (FS) Support and Treatability Study. The FS Support will consist of revising the feasibility study based on regulators comments. The Treatability Study will consist of conducting a field demonstration of in-situ vitrification based on current plans and data.

The purpose of the Savannah River ER Project is to assess and cleanup facilities and sites that are no longer a part of active operations, including the D&D of facilities. The primary regulatory drivers are the Savannah River Site (SRS) Resource Conservation and Recovery Act (RCRA) Hazardous waste permit and the CERCLA FFA, which was signed in January 1993, but will not be fully implemented until Appendices D and E are developed, approved, and incorporated. The Hazardous waste permit lists Solid Waste Management Units (SWMUS) which must undergo RCRA Facility Investigation. The FFA describes how the SRS must comply with both the RCRA and the CERCLA and, when made effective, defines the schedule from which contaminated sites are assessed and closed. In addition to the FFA, the SRS must comply with existing settlement agreements and the Natural Resources Defense Council Lawsuit. Currently, final FFA schedules are being negotiated. D&D is primarily driven by DOE orders.

The scope of the project for FY 1996 is to complete the assessment of all sites currently identified in the FFA and begin closure activities on approximately 50% of these sites. The scope of the ground water activities is to complete the installation of remediation facilities in the 200 and 3/700 Areas and begin progress in the remediation of the 100 Areas. D&D program support activities will continue under the Surplus Facility program.

2286

1.	Title and location of project: Savannah River (SR) Site Environmental Restoration Savannah River, South Carolina	2a.	Project No. D/ND-1.4.16
		2b.	Operating Expense Funded

9. Method of Performance

The Management and Operating (M&O) contractor at the SRS, the WSRC, will manage and execute the entire project under the direction of DOE. Construction and procurement will be accomplished utilizing fixed-price subcontractors awarded on the basis of competitive bidding, where in the best interest of the Goverument.

The M&O contractor or another designated contractor will manage and execute the entire project. D&D will be accomplished primarily utilizing fixed-price subcontracts awarded on the basis of competitive bidding, where possible.

10. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1995	FY 1996	FY 1997	(FY 98-01) Outyears	Total
a. Subproject Summary Level						
1. Remedial Action	$ 304,872	$ 86,470	$ 76,684	$ 92,971	$ 294,922	$ 855,919
2. Decontamination & Dismantlement	13,954	20,811	21,753	13,273	4,189	73,980
3. Long-term S&M	5,332	2,907	1,619	1,954	11,640	23,452
4. Landlord	0	0	0	0	0	0
5. Compliance Oversight	0	273	4,062	3,559	15,475	23,369

Total	$ 324,158	$ 110,461	$ 104,118	$ 111,757	$ 326,226	$ 976,720

11. Design and Construction of Federal Facilities

All DOE facilities are designed and constructed in accordance with applicable Public Laws, Executive Orders, Office of Management and Budget Circulars, Federal Property Management Regulations, and DOE Orders. The total estimated cost of the project includes the cost of measures necessary to assure compliance with Executive Order 12088, "Federal Compliance with Pollution Control Standards"; section 19 of the Occupational Safety and Health Act of 1970, the provisions of Executive Order 12196, and the related Safety and Health provisions for Federal Employees (CFR Title 29, Chapter XVII, Part 1960); and the Architectural Barriers Act, Public Law 90-480, and implementing instructions in 41 CFR 101-19.6.

2287

WASTE MANAGEMENT - DEFENSE

PROGRAM MISSION

For nearly five decades the Department of Energy (DOE) and its predecessors, the Energy Research and Development Administration and the Atomic Energy Commission, have been generating radioactive waste from defense nuclear material production, research, and development activities. Those activities produced large quantities of waste, which was stored or disposed of in a manner that does not meet today's more stringent environmental, safety and health requirements. Much of the stored waste contains radioactive materials, hazardous chemicals, or both.

Based on recent world events and the downsizing and reconfiguration of the nuclear weapons complex, the volume of high-level and transuranic waste generated by Defense Programs over the next several years is expected to diminish greatly. However, because of that very downsizing, waste generated by the closure of facilities and acceleration of cleanup is expected to increase.

The mission of the Waste Management Program is to protect people and the environment from the hazards of DOE waste by providing an effective and efficient system to treat, store, and dispose of the waste as soon as possible. The Department has developed integrated planning strategies for each type of waste managed across the DOE complex, including: high-level waste (HLW), transuranic waste (TRU), low-level waste (LLW), mixed low-level waste (MLLW), hazardous waste (HAZ), and sanitary waste (SAN). These strategies support the waste management mission by focusing on a 10-year horizon, when much progress will be made. The strategies incorporate performance measures to evaluate progress on reducing the current backlog of waste through treatment and disposal and the ability to routinely manage new waste as generated. By 2005, each waste-type program will achieve at least half of its overall mission, with the exception of HLW. The budget supports maintaining an acceptable level of risk, while making significant progress toward mission completion in FY 1997. The following matrix summarizes the strategies for each waste type over the 10 year planning horizon.

DOE WASTE MANAGEMENT SYSTEM STATUS

WASTE TYPE	STORAGE-BASE	TREATMENT	DISPOSAL	PROGRESS TO MISSION COMPLETION EXPECTED BY 2005
HIGH-LEVEL	o 350,000 m^3 stored safely at 3 sites. o Maintenance/upgrades required	o DWPF begins treatment in 1996 o Hanford privatization strategy o Idaho planning	o Deep geologic repository	o 1,900 Canisters produced at SRS o Plans for treatment at RL, ID
TRANSURANIC	o 109,000 m^3 stored at 17 sites o Capacity added as needed	o Some treatment required for transportation o Treatment for disposal uncertain	o At WIPP beginning in 1998	o 15,100 m^3 expected to be disposed
MIXED LOW-LEVEL	o 56,000 m^3 stored at 27 sites o Waste water volume reduction ongoing o Capacity added as needed	o Some treatment in operation o FFCA process sets treatment strategy	o Site selection process underway	o 91,000 m^3 disposed or road ready
LOW-LEVEL	o 62,966 m^3 stored at 27 sites o Capacity added as needed	o Some treatment for stabilization volume reduction in place	o Disposal at 6 sites o Alternatives being re-evaluated through WM PEIS process	o 594,400 m^3 expected to be disposed
HAZARDOUS/SANITARY	o Hazardous waste temporarily stored at site of generation with permits as required o No sanitary waste is stored	o Commercial services used o Some sanitary waste treated on site	o Commercial services used o Landfills on some sites	o Ongoing treatment and disposal o Mission complete for hazardous/sanitary waste

WASTE TYPE STRATEGIES:

High-Level Waste

High-level waste is the highly radioactive material resulting from the reprocessing of spent nuclear fuel. It includes mainly liquid waste remaining from the recovery of uranium and plutonium from spent fuel. Currently, there are about 350,000 cubic meters of HLW in storage, with a radioactivity content of about one billion curies. Because of the high radiation level of the waste, it must be remotely-handled and heavily shielded. Also, because it generates heat on its own from radioactive decay, provisions are needed to dissipate heat, thus adding to the cost of managing this type of waste. Some tanks containing HLW at the Hanford Site are among the most urgent risks in the complex due to health and safety concerns.

The long-term objective in the management of HLW is to dispose of the radioactive portion of the waste in a geologic repository. The Waste Management Program supports activities by other DOE organizations to assure a geologic repository is completed. Near-term goals for the Waste Management Program include solidifying liquid HLW through operations of the Defense Waste Processing Facility at the Savannah River Site in South Carolina and solidification of liquid to a calcine form at the Idaho National Engineering Laboratory. In FY 1997, it is expected that between 80 and 150 canisters will be produced as a result of solidification of 1700m^3 at DWPF and 530m^3 of liquid high-level waste will be calcined at Idaho. Other actions to support the near-term goal include studies at Hanford and Idaho to determine the appropriate final waste form and technology to be used to achieve waste solidification and ultimate disposal. These activities will allow for approximately 10 percent of the overall mission of the high-level waste program to be completed by the end of FY 1997.

Transuranic Waste

Transuranic (TRU) waste is radioactive waste containing more than 100 nanocuries per gram of alpha-emitting isotopes with atomic numbers greater than 92 (uranium) and half-lives greater than 20 years. This waste is the result of fuel reprocessing and the fabrication of plutonium weapons or plutonium-bearing reactor fuels. For some TRU waste, little or no shielding is required; this is referred to as "contact-handled" TRU waste. On the other hand, there is TRU waste containing radionuclides which require shielding because of their gamma or neutron emissions. These are referred to as "remote-handled" TRU waste. There are currently about 109,000 cubic meters of TRU waste as well as alpha contaminated mixed waste in the Environmental Management inventory, representing about 2 million curies. There are six major sites where TRU waste is located: the Los Alamos National Laboratory, the Rocky Flats Environmental Technology Site, the Oak Ridge National Laboratory, and the Hanford, Idaho, and Savannah River Sites.

It should also be noted, that prior to 1970, TRU waste was considered LLW and disposed through burial. At that time, it was realized that greater confinement from the environment was needed. Since the early 1970's, TRU waste has been segregated from other radioactive waste and placed in retrievable storage. The pre-1970 waste is referred to as "buried" TRU and is managed by the Environmental Restoration Program. Waste that is able to be retrieved from storage is managed by the Waste Management Program.

PROGRAM MISSION - WASTE MANAGEMENT - DEFENSE (cont'd)

Transuranic Waste

The near-term goal of the TRU waste program is to complete regulatory requirements to allow the disposal of defense-related TRU waste at the Waste Isolation Pilot Plant (WIPP) near Carlsbad, New Mexico, beginning in 1998. The long-term goal is to dispose of all TRU waste in this repository if it is found to be acceptable. By preparing WIPP to accept waste, DOE can further its mission to effectively manage waste. Moreover, by opening WIPP, a significant portion of this waste will be isolated from the environment and safely disposed. The majority of the activities in FY 1997 to advance the TRU program are related to opening WIPP and preparing waste for shipment to WIPP at Idaho, Los Alamos, and Oak Ridge. These activities will allow for approximately 10 percent of the overall mission of the TRU program to be completed by the end of FY 1997.

Low-Level Waste

Low-level waste is defined as any radioactive waste, which is not high-level, transuranic, spent nuclear fuel, or mill tailings. The majority of LLW is material contaminated with small amounts of radioactivity and can be contact-handled. However, a small amount can also be sufficiently radioactive as to require shielding to protect workers, the public, and the environment.

Generally speaking, LLW is disposed as it is generated. Low-level waste is currently disposed at the Los Alamos National Laboratory, and the facilities managed by the Idaho, Savannah River, Oak Ridge, Nevada, and the Richland Operations Offices; the last two sites also accept off-site LLW from the DOE Complex. Through 1994, about 3,000,000 cubic meters of LLW had been disposed at all DOE sites representing approximately 1,300,000 curies.

The near-term and long-term goals of the defense funded LLW Management Program are nearly identical: to continue disposal of LLW in an environmentally-safe manner at a pace to match generation of the waste. The benefits of this program include the disposal of very large volumes of waste in a manner which protects workers and the public, meets DOE requirements, and is cost-efficient. In FY 1997, it is expected that approximately 50,000m^3 of low-level waste will be disposed and approximately 200m^3 will be treated to allow for volume reduction-prior to disposal. These activities will allow for about half of the overall mission of the Low-Level Waste Program to be complete by the end of FY 1997.

Mixed Low-Level Waste

Mixed low-level waste consists of waste containing both hazardous (as defined by the Resource Conservation and Recovery Act) and radioactive (as defined by the Atomic Energy Act) components and is not high-level, low-level, or TRU waste. There is approximately 58,000 cubic meters of mixed low-level waste in inventory. The long-term goal for mixed low-level waste is to develop the necessary treatment and disposal capacity needed to dispose of the existing inventory as well as any newly generated waste.

2293

Mixed Low-Level Waste

The Department worked with the states, the Environmental Protection Agency (EPA), Indian Tribes, and stakeholders through the Federal Facility Compliance Act process and other mechanisms to develop a national configuration of mixed waste treatment facilities. The Department will have in place by 1997 35 Site Treatment Plans enforced by the state or EPA through compliance orders for the development of mixed waste treatment capacity. The Department is also continuing to work with the states, EPA, Indian Tribes, and stakeholders to determine location of disposal facilities. The near-term goal for mixed waste is to develop treatment capacity as outlined in the Site Treatment Plans and to complete site selection for disposal facilities. In FY 1997, it is expected that approximately 4,000 m^3 of waste will be treated at various DOE and private facilities. Many activities related to securing contracts with private vendor's will also be ongoing in FY 1997. These activities will allow for approximately 10 percent of the overall mission of the mixed low-level waste program to be complete by the end of FY 1997.

Hazardous and Sanitary Waste

Hazardous waste is defined by the Resource Conservation and Recovery Act (RCRA). It consists of waste, which because of its concentration or physical or chemical characteristics, may cause or contribute to mortality or illness or pose a substantial threat if not properly managed. Hazardous waste can be harmful to humans by chemically or physically attacking skeletal, nervous, or other bodily systems. In many ways, hazardous waste is more difficult to manage than radioactive waste because chemicals in waste may have an unknown synergistic effect and exposure cannot be easily monitored. The most common hazardous wastes generated by DOE include spent solvents, corrosives, ignitables, metals, specialty chemicals used by research and development laboratories, explosives, polychlorinated biphenyls (PCBs), and asbestos. In FY 1997, the Waste Management Program is expected to treat and/or dispose approximately 6,000 cubic meters of hazardous waste. Hazardous waste is primarily treated and disposed of by commercial vendors.

Sanitary waste is office waste, cafeteria waste, sewage, sewage sludges, plastic, wood, rubber, rags, and similar materials. Solid sanitary waste is disposed in approved sanitary landfills, and liquid sanitary waste is treated in wastewater treatment facilities prior to discharge to receiving streams. The Department uses both on-site and off-site disposal facilities for sanitary waste treatment and disposal.

The near- and long-term goals for both hazardous and sanitary waste are the same: maintain regulatory compliance while cost effectively treating and disposing of waste as it is generated. The mission of the hazardous/sanitary waste program has been realized and in FY 1997 activities continue. Efforts focusing on improvements to the efficiency of that program will be ongoing.

PROGRAM MISSION - WASTE MANAGEMENT - DEFENSE (cont'd)

The GOALS of the Defense Waste Management program are:

1) To protect public and worker safety and health and the environment from the dangers of DOE's radioactive and hazardous waste. The Program will continue to make progress on reducing long-term risk by treating waste with the goal of ultimate disposal.
2) To focus on resolving the highest risk problems in the complex while reducing infrastructure and overhead costs. There is the possibility that some lower risk requirements may not be met on time, but the Department believes this strategy is acceptable in order to meet our cost reduction goals.
3) To perform activities related to treatment and disposal, to move towards completion of mission. Ongoing treatment and disposal will continue to work off the backlog of waste, new and existing facilities will routinely treat and dispose of new waste.

The PERFORMANCE MEASURES related to these goals are:

The Office of Waste Management plans to measure success of its FY 1997 program by the amount of DOE waste it treats, stores, and disposes. Crosscuts are included showing the approximate level of funding in this budget request for these measures by various waste types.

Specific Waste Storage Activities include:

1) Maintain safe and compliant storage of over 500,000 m^3 of waste around the DOE complex.

2) Maintaining/improving safety of tank waste storage at Hanford, Washington;
   - o Resolve the urgent risks, such as the explosive gas generated in HLW Tanks at Hanford.

Specific Waste Treatment Activities include:

1) Operation of the Defense Waste Processing Facility at the Savannah River Site to reduce risk associated with storage of liquid HLW;
   - o Production of between 80 and 150 canisters at Defense Waste Processing Facility (DWPF) and process 3 million gallons of saltstone grout.

2) Operate New Waste Calcining Facility at Idaho to convert 530 cubic meters of liquid HLW into calcine.

3) Privatizing operations where economic efficiencies clearly warrant such action;
   - o Privatization of waste treatment for low-level, TRU, and MLLW at various locations throughout the complex in order to reduce the cost of "in-house" services and to stimulate the commercial sector capability.
   - o Continue operations of M-Area Vendor treatment of MLLW at Savannah River.
   - o Begin NEPA and permitting preparations for the Advanced Mixed Waste Treatment Facility at Idaho.

PROGRAM MISSION - WASTE MANAGEMENT - DEFENSE (cont'd)

Specific Waste Treatment Activities include: (cont'd)

4) Implementing Site Treatment Plans as negotiated through the Federal Facility Compliance Act process;
   - o Begin or accelerate mixed waste treatment at various DOE locations in response to the Federal Facility Compliance Act.
   - o Continue operating the Toxic Substances Control Act (TSCA) Incinerator at Oak Ridge, Tennessee, and Waste Experimental Reduction Facility (WERF) at Idaho to treat mixed low-level waste;
   - o Begin operations at Consolidated Incineration Facility (CIF) at Savannah River.
   - o Secure contracts for private vendor treatment for mixed waste at Oak Ridge and Idaho.

Specific Waste Disposal Activities include:

1) Finalizing the regulatory compliance packages for submittal to the Environmental Protection Agency and the state of New Mexico for the Waste Isolation Pilot Plant (WIPP);
   - o Achieve facility readiness for FY 1998 TRU waste receipt at WIPP.
   - o Prepare TRU waste in FY 1997 for initial shipments to WIPP beginning in FY 1998 from Idaho, Rocky Flats, and Los Alamos and in FY 2002 from Oak Ridge.

2) Low-level waste disposal - anticipated disposal is 50,000m^3 of LLW at six sites.

The following list defines the funding categories used in this budget by the Office of Waste Management. The Program is planning to change these categories in the near future to align the description of work performed to waste type.

Program Management

The regulatory environment in which the Waste Management works involves a considerable amount of oversight and review from regulatory and other federal, state, or local agencies to assure DOE meets regulatory expectations. This portion of the budget provides for support and oversight of the Waste Management Program to help assure these expectations are met. It includes strategic and long-range planning, and provides for technical expertise on Safety and Environmental documentation preparation and review. Also included here is a request for funding to address the requirements of the Federal Facility Compliance Act, Agreements-In-Principle and Payments to Local Communities, which fund agreements with states and Indian Nations, are similar in that both categories fund negotiated agreements with external groups for their oversight of the DOE Waste Management program at specified sites.

The near-term goal is to have sufficient support and oversight so that no environmental, health or safety non-compliances occur. The benefits include adequate support for management control, planning, cost reviews and identification of environment, safety or health issues, which can be dealt with in a reasoned and structured manner. It also assists and builds DOE's credibility with states and Indian Tribes whose oversight activities are funded through direct grants.

2296

Facility Operations and Maintenance

The Waste Management Program must treat, store, and dispose of a large volume of newly generated and inventoried waste. If no new waste was generated, the Program would need to manage the legacy waste accumulated over forty years of weapons research, development, and production. This budget category funds day-to-day operations and maintenance of existing facilities to safely treat, store, and dispose of all previously described waste types in an environmentally safe manner. The problems associated with a program this size include compliance with a wide variety of federal, state, and local, and sometimes conflicting environmental regulations.

New Facilities

This program category includes the costs of engineering studies, designs, and construction costs of new projects and modifications to existing facilities needed for waste management operations. It also includes any environmental impact documentation, Safety Analysis Reviews and Operational Readiness Review necessary to construct and begin operations of a new or substantially modified facility. Once the facility is operating, all of annual and outyear costs, including capital equipment not related to construction, will be funded under the Facilities Operations and Maintenance budget.

Defense Waste Processing Facility (DWPF)

This activity includes the management, operations, and maintenance costs for the DWPF at the Savannah River Operations Office. The DWPF hot startup is to occur in early March 1996.

Waste Isolation Pilot Plant

The Waste Isolation Pilot Plant (WIPP) was authorized by Congress in 1979 (Public Law 96-164) as the nation's first research and development facility to demonstrate the safe shipment, emplacement, and geologic disposal of defense transuranic (TRU) wastes. WIPP is currently scheduled to reach a disposal decision in 1998.

The TRU waste was a by-product of the nation's nuclear weapons research, development, production, and decommissioning activities. Originally, TRU waste was buried as low-level waste in DOE constructed landfills. Since 1970, however, TRU waste has been placed in retrievable storage pending the completion and opening of a geologic disposal facility. The WIPP site is located in southeastern New Mexico near Carlsbad, 2,150 feet underground in ancient salt beds, which provide a stable medium for disposal. In October 1992, Congress passed the WIPP Land Withdrawal Act (Public Law 102-579), which permanently transferred public lands to DOE. The act also established about 140 separate requirements for DOE and other Federal Agencies. Key among the new requirements was a new regulatory framework in which the Environmental Protection Agency (EPA) must certify WIPP's compliance with the radioactive waste disposal standards (40 CRF 191) prior to establishing WIPP as a disposal site. In October 1993, DOE initiated a revised test strategy where tests with radioactive waste would be conducted in laboratories rather than underground at WIPP. This enhanced laboratory program would collect required technical data more quickly at a lower cost. Additionally, DOE accelerated the preparation of a

2297

Waste Isolation Pilot Plant (cont'd)

draft compliance application document and submitted the document to the EPA in March 1995. Current major WIPP program activities include: (1) conducting an experimental program to obtain the necessary data to characterize the repository environment, including field studies, laboratory studies, engineering design, and modeling studies; (2) completing performance assessment analyses to predict the long-term behavior of the repository; (3) performing waste characterization activities to characterize WIPP waste at the generator sites; (4) preparing regulatory compliance certification packages for submittal to the EPA, the state of New Mexico, and other stakeholders to demonstrate compliance with the requirements of federal regulations (40 CFR 191, 264, and 268); and (5) maintaining the WIPP facility in compliance with DOE rules and regulations and with the necessary staffing to ensure the operational integrity of the facility. During FY 1996, one of the major activities will be the preparation of the final 40 CFR 191 regulatory compliance certification application for submission to EPA in October 1997. Also scheduled for completion is the Disposal Phase Supplemental Environmental Impact Statement Record of Decision in March 1997. The DOE anticipates EPA's issuance of the WIPP no migration determination by June 1997.

The National TRU Program was established by DOE to ensure that all TRU waste within the purview of DOE is effectively managed from generation to final disposal. This is accomplished by developing strategic plans and program guidance for TRU waste generation, characterization, certification, packaging, transport, and disposal.

Solid Waste

Funds provided under this budget category address corrective activities necessary to bring out-of-compliance defense facilities into compliance with RCRA, TSCA, provisions of the Hazardous and Solid waste Amendments, State and local ordinances, and DOE Orders. The FY 1996 funding begins physical construction of the Hazardous Waste Treatment Facility at Los Alamos National Laboratory. In response to direction from Congress, the Corrective Activities budget was combined with the Waste Management Program in FY 1996. All projects are completely funded, so there will be no future requests for new Corrective Activities.

WASTE MANAGEMENT - DEFENSE

ALBUQUERQUE

I. Mission Supporting Goals and Objectives

The Albuquerque Operations Office (AL) manages seven sites in five states. The sites may be categorized into four groups: production facilities, research and development laboratories, a project office, and one waste disposal demonstration project. The production facilities include the Kansas City Plant and the Pantex Plant which were associated with the production of special materials and assembly of weapons or weapons components. The laboratories, which consist of the Los Alamos National Laboratory (LANL), Sandia National Laboratory (SNL)-New Mexico, and SNL-California have been involved in studies related to nuclear and non-nuclear weapons components. The Grand Junction Projects Office spearheads an aggressive mixed waste treatment program for all Albuquerque sites. The waste produced at these facilities include low-level, mixed, hazardous and sanitary waste streams, and small amounts of other waste from research. The primary waste management activities include storage, treatment, and disposal of waste. The last site - the Waste Isolation Pilot Plant (WIPP) funded through the Carlsbad Area Office - is a proposed underground repository facility designed to provide safe disposal of defense-generated post-1970 TRU waste.

The Albuquerque Operations Office will treat and dispose of approximately 20,000 m^3 of all waste types except high-level waste in FY 1997.

The facility which produces the largest volume of waste within AL is LANL, and its most significant waste management challenge relates to the remediation of its TRU waste storage pads. The State of New Mexico inspected the facilities and found that TRU waste was not being properly stored. The State issued a Notice of Violation, and a compliance agreement with the State has been signed. Construction of temporary storage facilities for the TRU waste began in FY 1995 supporting removal of approximately 7000 cubic meters of TRU waste from existing non-compliant storage. The FY 1997 budget provides for acceptable compliance risk at all Albuquerque sites with the exception of the LANL TRU PAD consent order with the State of New Mexico, which will have to be renegotiated. In the area of mixed waste treatment, Albuquerque will focus on developing small scale mixed waste mobile treatment units where appropriate. These units can be shared, thereby minimizing capital outlays at each site. Additionally, budget profiles for previously planned treatment facilities at LANL and the Pantex Plant have been adjusted to reflect realistic project requirements.

I. Mission Supporting Goals and Objectives - Albuquerque (cont'd)

The Waste Isolation Pilot Plant is on schedule for initial waste receipt in FY 1998, and will continue or complete many of the Land Withdrawal Act requirements in FY 1997. Major activities expected to be completed include the submission to the EPA of the final regulatory compliance certification application (40 CFR 191), issuance of a No Migration Determination by EPA, issuance of the Disposal Phase Supplemental Environmental Impact Statement Record of Decision, and preparations for start of disposal operations in FY 1998.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 9,202	$ 4,220	$ 2,242	$ -1,978	-47%
Facility Operations and Maintenance	94,241	87,855	84,560	-3,295	-4%
New Facilities	4,831	7,369	3,130	-4,239	-57%
Solid Waste	0	0	0	0	0%
Carlsbad Area Office	169,804	177,700	165,951	-11,749	-7%
TOTAL, Albuquerque	$ 278,078	$ 277,144	$ 255,883	$-21,261	-8%

III. Performance Summary

FY 1995 Accomplishments

ALBUQUERQUE

- o Commenced Site Wide Environmental Impact Statement (EIS) at LANL and continued the Pantex Plant site-wide EIS.
- o Met all FFCAct deliverables and milestones at the Albuquerque Sites.
- o Completed excavation of new remote-handled transuranic (TRU) shafts and emplaced 39 cubic meters of TRU waste in acceptable storage at LANL.
- o Implemented seven new recycling programs at Pantex including 4000 cubic yards of concrete, 6000 pounds of tungsten, 2000 pounds of nickel, and 1340 tons of sanitary plastics, paper, and cans.
- o Successfully concluded the Nevada Operations (NVO) audit and began to ship LLW from SNL-NM, Kansas City, and ITRI to the Nevada Test Site (NTS) for disposal.
- o Continued design of a High Explosive Waste Water Treatment Facility at LANL, Project No. 94-D-400.
- o Began construction of RCRA Hazardous Waste Staging Facility at Pantex, Project No. 190-D-126.
- o Completed and closed out the Industrial Waste System Project at LANL.

III. Performance Summary - Albuquerque (cont'd)

FY 1997 Planned Accomplishments

Carlsbad Area Office

o Continue base facility activities, including Environmental Safety and Health, complete the Final Safety Analysis Report for disposal, surface and underground maintenance, and stakeholder program	$98,400
o Complete preparation of final Compliance Certification Application and submit to EPA; continue tests and analysis for performance confirmation, issue the Final Environmental Impact Statement for the disposal phase, and receive the No Migration Determination from the EPA (anticipated)	41,400
o Continue activities to achieve contact-handled waste facility readiness to receive waste in FY 1998, hiring 45 additional contractor FTE's	12,500
o Continue National TRU Program activities, including waste characterization and management studies	4,800
o Continue performance improvement activities such as the electrical service construction line-item project	800
o Continue remote-handled waste plans and activities	1,100
o Continue compliance certainty activities such as waste characterization	6,951
Subtotal, Carlsbad Area Office	$165,951
TOTAL, ALBUQUERQUE	$255,883

Explanation of Funding Changes FY 1996 to FY 1997

- o Reduction due to completion of construction at several sites.
- o Low-level waste disposal shipments from Sandia, New Mexico and Pantex will be curtailed, causing a decrease.
- o Mixed Waste Treatment Program reduces mobile treatment due to new commercial capabilities.
- o WIPP decreases as significant regulatory requirements are not in FY 1996, and site budget prepares to receive waste in FY 1998.

Major Issues

- o None

III. Performance Summary - Albuquerque (cont'd)

FY 1996 Accomplishments (To Date and Planned)

Carlsbad Area Office

- Complete Land Withdrawal Act requirement for Waste Technology Study and submit to Congress.
- o Complete Land Withdrawal Act requirement for remote-handled TRU waste study and publish the findings in the Federal Register.
- o Complete collection of data needed for calculations to regulatory compliance package.
- o Complete and submit final No Migration Variance Petition to EPA.
- o Complete draft SEIS for disposal.
- o Continue the National TRU Program waste characterization and TRU waste management studies.
- o State of New Mexico issues RCRA Part B Permit (anticipated).

FY 1997 Planned Accomplishments

ALBUQUERQUE

o Continue base waste management program at seven AL sites in five States, including maintenance and operation of existing waste management facilities for treatment, storage and disposal of LLW, LLMW, TRU, Mixed-TRU's, sanitary, and hazardous wastes, characterization of backlog waste, program management and oversight activities related to budget, health and safety programs, training, and maintaining stakeholder involvement	$58,058
o Develop and operate mobile treatment units to treat legacy and newly generated mixed waste at AL and other DOE sites to comply with the FFCAct	4,851
o Operate and maintain outdated Radioactive Liquid Waste Treatment Facility and begin design on replacement facility at LANL to reduce imminent risk to workers and the environment and to meet Clean Water Act permitting requirements	6,936
o Replace faulty, leaking overhead industrial waste piping system linking the main manufacturing building and five smaller facilities to the Industrial Waste Water Pretreatment Facility at the Kansas City Plant to prevent release of hazardous materials to the environment and to achieve compliance with RCRA	2,390
o Continue on-site disposal of 6000 m^3/yr of LLW at LANL including receipt, placement, compaction, shaft, and pit excavation, inspections and maintenance	6,201
o Continue remediation and storage of 7000 cubic meters of TRU waste at LANL including retrieval of waste from non-RCRA compliant storage units and placement into RCRA compliant, monitored and retrievable storage pads and domes in order to meet Land Disposal Restriction - Federal Facility Compliance Agreement	11,496
Subtotal, Albuquerque	$89,932

III. Performance Summary - Albuquerque (cont'd)

FY 1997 Planned Accomplishments

Carlsbad Area Office

o Continue base facility activities, including Environmental Safety and Health, complete the Final Safety Analysis Report for disposal, surface and underground maintenance, and stakeholder program	$98,400

Explanation of Funding Changes FY 1996 to FY 1997

- o Reduction due to completion of construction at several sites.
- o Low-level waste disposal shipments from Sandia, New Mexico and Pantex will be curtailed, causing a decrease.
- o Mixed Waste Treatment Program reduces mobile treatment due to new commercial capabilities.
- o WIPP decrease as significant regulatory requirements are not in FY 1996, and site budget prepares to receive waste in FY 1998.

Major Issues

- o None

IDAHO

I. Mission Supporting Goals and Objectives

The Idaho National Engineering Laboratory (INEL) is located in southeastern Idaho and encompasses an area of about 890 square miles (2,300 square kilometers). The Idaho Operations Office manages operations at the Idaho Chemical Processing Plant (ICPP), the Radioactive Waste Management Complex (RWMC), the Waste Reduction Operations Complex (WROC), and the Test Area North (TAN) for the Waste Management Program. Idaho manages all waste types and has developed strategies to make progress on each waste type. In FY 1997 85,000 m^3 of waste will continue to be safely stored. A recent settlement agreement with the State of Idaho requires much progress to be made in preparing waste for eventual disposal. Activities to be focused on include treatment of 530 m^3 of liquid high-level waste for safe storage, treatment of approximately 400 m^3 of low-level and low-level mixed waste at the Waste Experimental Reduction Facility and securing contracts for operation of a major treatment facility, which will begin treatment of TRU and alpha contaminated mixed low-level waste in future years.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 9,631	$ 3,160	$ 1,960	$ -1,200	-38%
Facility Operations and Maintenance	129,815	137,677	94,148	-43,529	-32%
New Facilities	16,066	22,977	14,674	-8,303	-36%
TOTAL, Idaho	$155,512	$163,814	$110,782	$-53,032	-32%

III. Performance Summary

FY 1995 Accomplishments

- o Consolidated five contractors at the INEL into one (Lockheed) to better integrate program planning, management, and save significant funding over the next five years.
- o Completed construction of five Resource Conservation and Recovery Act compliant Waste Storage Facility modules and began moving TRU waste into those modules.
- o Restarted operating Waste Experimental Reduction Facility (WERF) at Waste Reduction Operations Complex (WROC) and incinerated 1,992 ft^3 of MLLW and 3,643 ft^3 LLW.
- o Issued the "DOE Spent Nuclear Fuel Managment and Idaho National Engineering Laboratory Environmental Restoration & Waste Management Programs Final EIS and Record of Decision".

2308

III. Performance Summary - Idaho (cont'd)

FY 1995 Accomplishments

- o Completed installation of high-level liquid waste evaporator at the Idaho Chemical Processing Plant (ICPP).
- o Issued the proposed Site Treatment Plan for mixed waste at INEL in accordance with the Federal Facility Compliance Act.
- o Initiated construction of the Transuranic Storage Area Retrieval Enclosure Facility.
- o Continued treatment/decontamination of mixed waste at WERF, including cask dismantlement, lead decontamination, and LLW volume reduction/compaction.

FY 1996 Accomplishments (To Date and Planned)

- o Initiate chargeback incentive system for LLW Treatment and Disposal.
- o Complete Federal Facility Compliance Act Consent Order Negotiations with the State of Idaho.
- o Continue Mixed Waste Incineration of MLLW and LLW at WERF.
- o Complete construction of remaining Waste Storage Facilities at RWMC.
- o Complete High-Level Waste Tank Farm Upgrades to meet Consent Order at ICPP.
- o Complete construction of Transuranic Storage Area Retrieval Enclosure at RWMC.
- o Commence High-Level Liquid Waste Evaporator operation at ICPP.
- o Issue Request for Proposal for private sector treatment of TRU and Alpha Mixed Waste, and select contractor.
- o Inspect at least one Tank Farm tank using the Light Duty Utility Arm Robot at ICPP.
- o Treat 48 HEPA filters through Filter Leach.

FY 1997 Planned Accomplishments

o Restart the New Waste Calcining Facility to process 140 thousand gallons of liquid HLW into more stable form at ICPP	$ 48,334
o Complete reconfiguration of stored TRU waste into RCRA compliant storage to meet Consent Order requirements; and accelerate characterization, examination, and certification of stored TRU waste in support of Agreement with State of Idaho	19,024
o Continue Mixed LLW and LLW treatment via WERF incinerator to work off 6,500 cubic feet of inventory at WROC	18,246
o Begin Phase I of the private sector treatment of TRU and alpha mixed waste to provide cost effective TRU treatment with potential benefits to WIPP facility performance evaluation	3,100
o Dispose of approximately 6,000 m^3 of LLW, and perform storage, sizing, and compaction operations for waste volume reduction	22,078
TOTAL, IDAHO	$110,782

III. Performance Summary - Idaho (cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

- Decrease in funding from FY 1996 to FY 1997 is a result of completion of line-item projects in FY 1996 (High-Level Waste Tank Farm Upgrade and the Transuranic Storage Area Retrieval Enclosure project).
- Approximately $30M of the FY 1997 reduction is because of one-time settlement fee payment for Fort St. Vrain Dry Fuel Storage Facility in Colorado and ramp down of Settlement Agreement and Site Treatment Plan activities.

Major Issues

- None

2310

NEVADA

I. Mission Supporting Goals and Objectives

The Nevada Operations Office (NV) manages the waste management program at the Nevada Test Site (NTS). The NTS covers about 1,350 square miles (3,500 square kilometers) and is located about 65 miles (100 kilometers) northwest of Las Vegas, Nevada. The primary mission for NTS is testing nuclear devices. The major waste management activity at NTS is disposal of offsite low-level radioactive waste. The site also stores 610 m^3 of TRU waste. The NTS is key in the completion of the overall mission of the EM program.

The NTS is the Nation's largest volume LLW disposal site (commercial or DOE). In 1994 and 1995, 85 percent of the DOE complex offsite LLW was disposed at NTS. Over 500,000 cubic meters of LLW has been disposed at NTS from the beginning of operations through 1995.

In FY 1997 the site has estimated to dispose of 23,000 m^3 of low-level waste. The majority of this waste comes from offsite. Activities will also continue leading towards a permitted mixed waste disposal facility.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 4,762	$ 565	$ 2,010	$ +1,445	+255%
Facility Operations and Maintenance	10,412	8,513	14,033	+5,520	+65%
New Facilities	6,379	6,434	560	-5,874	-91%
TOTAL, Nevada	$ 21,553	$ 15,512	$ 16,603	$ +1,091	+7%

III. Performance Summary

FY 1995 Accomplishments

- o 24,400 m^3 of LLW was emplaced in shallow land disposal in FY 1995.
- o Performed 32 Radioactive Waste Acceptance Program Audits/Surveillances in FY 1995. (Approval pending from Nevada's Waste Management Program for 6 waste generators for disposal at NTS as of July 1995.)
- o Completed TRU Pad Cover Building.
- o Completed draft Safety Analysis Report for Areas 3 and 5 Radioactive Waste Management Sites.
- o Established Community Advisory Board.

III. Performance Summary - Nevada (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- o Operate two Radioactive Waste Management Sites at NTS for the disposal of bulk and containerized LLW from the DOE complex.
- o Begin reconstruction of road to the Radioactive Waste Management Site.
- o Complete NTS site-wide EIS.
- o Performed ten Radioactive Waste Acceptance Audits/Surveillances in support to receive offsite generators waste and dispose it at NTS facility.

FY 1997 Planned Accomplishments

o Fund Waste Management Program, including disposal of waste generated on-site, TRU storage, and other waste management efforts	$13,559
o Continue LLW disposal operations for approved offsite generators	3,044
o Complete road reconstruction with carryover funding	0
TOTAL, NEVADA	$16,603

Explanation of Funding Changes FY 1996 to FY 1997

- o No new projects will be initiated.
- o Continue with performance assessment and site characterization activities.

Major Issues

- o None

2312

OAKLAND

I. Mission Supporting Goals and Objectives

The Oakland Operations Office manages waste operations at the Laboratory for Energy-Related Health Research (LEHR), Lawrence Berkeley National Laboratory (LBNL), Lawrence Livermore National Laboratory (LLNL), the Energy Technology Engineering Center (ETEC), and the Stanford Linear Accelerator Center (SLAC). The facilities perform a number of diverse research and development activities. Only LLNL is funded from the Defense Appropriation.

The Lawrence Livermore National Laboratory is an energy research and weapons development laboratory. Compliant storage, treatment, and offsite shipment for disposal of both legacy and currently generated hazardous and radioactive waste is the primary objective of the Waste Management program at LLNL.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 2,243	$ 2,068	$ 1,095	$ -973	-47%
Facility Operations and Maintenance	31,203	23,737	20,509	-3,228	-14%
New Facilities	10,689	22,217	12,500	-9,717	-44%
TOTAL, Oakland	$ 44,135	$ 48,022	$ 34,104	$-13,918	-29%

III. Performance Summary

FY 1995 Accomplishments:

- Began Title I design for both the Decontamination Waste Treatment Facility (DWTF), Project No. 86-D-103, and the Mixed Waste Management Facility (MWMF).
- Continued Program Management to support FFCAct, waste minimization, and other requirements.
- Continued to operate and maintain existing treatment and storage facilities for hazardous, mixed, low-level radioactive and transuranic waste, and characterize and repackage hazardous and LLW for offsite shipments.
- Continued the construction of the Sanitary Sewer Rehabilitation project, Project No. 92-D-402, and the Tank Upgrades project, Project No. 92-D-403.

III. Performance Summary - Oakland (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- o Begin construction of the DWTF and long lead procurement for MWMF.
- o Continue Program Management to support FFCAct activities and other requirements.
- o Continue to operate and maintain existing treatment and storage facilities for hazardous, mixed, low-level radioactive and transuranic waste, and characterize and repackage hazardous and LLW for offsite shipments.
- o Complete construction of the Sanitary Sewer Rehabilitation project and the Tank Upgrade project, using prior year funds.

FY 1997 Planned Accomplishments

o Continue construction of DWTF and initiate fabrication of MWMF	$12,500
o Continue Program Management to support FFCAct activities and other requirements	1,095
o Continue to operate and maintain existing treatment and storage facilities for hazardous, mixed, low-level radioactive and transuranic waste, and characterize and repackage hazardous and LLW for offsite shipment	20,509
TOTAL, OAKLAND	$34,104

Explanation of Funding Changes FY 1996 to FY 1997

- o Reduction to Mixed Waste Management Facility due to completion of long-lead procurement in FY 1996.
- o Elimination of backlog of legacy waste through treatment and disposal in FY 1996 reduces funding requirement in FY 1997.

Major Issues

- o None

OAK RIDGE

I. Mission Supporting Goals and Objectives

The Oak Ridge Operations Office in Oak Ridge, Tennessee, manages the K-25 Site (formerly Oak Ridge Gaseous Diffusion Plant), the Oak Ridge National Laboratory (ORNL), and the Oak Ridge Y-12 Plant for the Waste Management Program at the Oak Ridge Reservation (ORR). The ORR has a Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA); Federal Facility Agreement (FFA); and an unilateral order for Resource Conservation and Recovery Act Land Disposal Restrictions (RCRA LDR).

The Oak Ridge Reservation manages all waste types with the exception of high-level waste. The site does manage over 70 percent of DOE's remote handled TRU waste, which presents problems similar to high-level waste. The site continues to make progress towards mission completion of all waste types. Approximately 1,000 m^3 of mixed low-level waste will be treated by the TSCA incinerator. 900 m^3 of low-level waste will be disposed on-site, off-site, or in a commercial facility. Major activities leading preparation of the remote handled TRU for shipment to WIPP will be underway in FY 1997. The site expects to be shipping TRU waste to WIPP in 2002. Activities leading towards securing a broad-spectrum privatized facility for the treatment of mixed low-level waste will be underway. It is expected that this facility will provide major capacity to meet the needs of the DOE complex. A significant accomplishment in FY 1997 for Oak Ridge will be the treatment of some mixed low-level waste by private companies, which is expected to reduce costs to DOE. The ORR is planning to build facilities for limited onsite disposal of LLW. Hazardous waste, is either treated on site, if economical, or sent off site for treatment and disposal by the private sector.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 11,481	$ 15,698	$ 2,989	$ -12,709	-81%
Facility Operations and Maintenance	141,088	150,197	150,647	+450	0%
New Facilities	44,065	25,992	10,392	-15,600	-60%
TOTAL, Oak Ridge	$196,634	$191,887	$164,028	$-27,859	-15%

III. Performance Summary

FY 1995 Accomplishments

- Operated and maintained over 100 treatment, storage, and disposal facilities for sanitary, hazardous, radioactive, and mixed waste in compliance with local, state, and federal safety and environmental requirements and regulations.
- Implemented off-site shipment procedures for over 300 m^3 of polychlorinated biphenyl (PCB) contaminated light ballasts and capacitors.

III. Performance Summary - Oak Ridge (cont'd)

FY 1995 Accomplishments - (cont'd)

- o Reduced radiation areas by 16,400 square meters, which avoids costs of over $1,000,000 annually.
- o Completed the following line-item projects: Y-12 Plant Steam Plant Ash Disposal facility, a corrective activity (on schedule and budget); K-25 Site K-1515 lagoon to meet National Pollutant Discharge Elimination System permit (three months ahead of schedule and $300,000 under budget): Y-12 Sanitary Landfill, phase I closure (ahead of schedule and $600,000 under budget).
- o Began construction of the Melton Valley Liquid LLW storage capacity increase line-item project (94-D-404) at ORNL.
- o Reduced uncosted by $29,000,000 and saved over $4,000,000 through cost efficiency improvements for managing projects and recycling initiatives.
- o Treated 1,610 m^3 of mixed waste/PCB-contaminated liquid waste in the TSCA Incinerator.
- o Submitted the Proposed Site Treatment Plan (STP) for mixed waste to the state as required by the FFCAct. Mixed TRU waste is emphasized in the proposed STP.
- o Replaced planned Mixed Waste Treatment Facility with privatization of treatment combined with general plant projects.
- o Implemented the Mixed Waste STP to comply with the FFCAct.
- o Continued operating existing waste management facilities in compliance with environmental regulations.

FY 1996 Accomplishments (To Date and Planned)

- o Continue activities to meet requirements of the FFA regarding liquid LLW tank systems at ORNL.
- o Complete the Plant Drains Wastewater Treatment upgrades (93-D-174) at Y-12 and rehabilitation of the sanitary sewer collection system at K-25; continue construction of the Melton Valley Storage Tank Capacity Increase project (94-D-404) for remote-handled (RH) TRU waste at ORNL.
- o Convert TSCA Incinerator to burn soft solids (such as cardboard boxes); treat 1,500 m^3 of liquid waste and 118 m^3 of solid waste.
- o A draft request for proposal will be published for private sector treatment of remote-handled transuranic sludge.
- o Initiate construction of Industrial Landfill V and construction/demolition Landfill VII, Phase II, Project No. 95-D-405.

FY 1997 Planned Accomplishments

- o Continue safe and regulatory compliant operation and maintenance of treatment, storage, and disposal facilities for sanitary, hazardous, radioactive, and mixed waste; treat 760 m^3 of liquid waste and 240 m^3 solid waste at the TSCA Incinerator; treat 500,000 m^3 of wastewater on a just-in-time basis; transport and track waste; characterize waste and certify waste acceptance criteria are met; prepare facility safety assessment documents $116,681
- o Continue construction of the Melton Valley LLW Storage Capacity Increase line-item project (94-D-404) at ORNL 6,795

III. Performance Summary - Oak Ridge (cont'd)

FY 1997 Planned Accomplishments - (cont'd)

o Perform FFA required leak testing of active LLW tank systems, and surveillance and maintenance of inactive LLW tank systems at ORNL	5,395
o Fund private sector Mixed Waste Treatment Program, to meet schedules in the FFCAct STP	23,460
o Continue construction of Industrial Landfill V and construction/demolition Landfill VII, Phase II, Project No. 94-D-405	350
o Implement characterization and Solid Waste Storage Area 5N closure, award contract to prepare remote-handled sludge for shipment to WIPP	11,347
TOTAL, OAK RIDGE	$164,028

Explanation of Funding Changes FY 1996 to FY 1997

- o Staff reorganization to reduce management redundancies and staff reductions will provide additional savings to reduce Program Management cost.
- o Completion of several construction projects has reduced the New Facilities funding level. Funding for new construction projects has been deferred in favor of using private sector treatment options and off-site disposal.

Major Issues

- o None

RICHLAND

I. Mission Supporting Goals and Objectives

The Richland Operations Office (RL) manages the Hanford Site, which is located on 560 square miles (1,450 square kilometers) in southeastern Washington. Hanford was among the first facilities constructed by the Manhattan Project. Historically, the Hanford mission was plutonium production, reactor and processing operations and research related to advanced reactors, energy technologies and basic sciences. All production activities ceased in 1989. Today the Hanford waste management mission is to safely and efficiently cleanup the previously generated, stored waste, often referred to as legacy waste.

The Hanford site manages large amounts of all waste types. A major priority with the site has been the safe storage of high-level waste as well as building the infrastructure to stabilize the high-level waste for disposal. Progress is being made on all waste types at varying rates. In FY 1997 7,400 m^3 of low-level waste will be disposed onsite. The Waste Receiving and Processing Facility (WRAP I) will begin treating low-level waste for disposal. Approximately 17,000 m^3 of transuranic (TRU) waste is retrievably stored at Hanford awaiting funding to retrieve, process and ship to the Waste Isolation Processing Plant (WIPP).

The Waste Management Program will manage current and future solid waste and liquid effluent streams in a safe, responsible, cost effective, and legally compliant manner. In FY 1997 the liquid Effluent Program will treat and dispose of 13,000m^3 of process condensate from the 242-A Evaporator through the Effluent Treatment Facility, dispose of about 900,000m^3 of treated effluent through the 200-Area Treated Effluent Disposal Facility, and 400,000 m^3 of non-radioactive process wastewater through the 300-Area Treated Effluent Disposal Facility. Analytical laboratories will provide site-wide characterization needs, e.g., providing data to perform necessary safety analyses for safe operations at the tank farms and other facilities. The site-wide decontamination services will provide decontamination, volume reduction, packaging services, equipment repair, liquid waste Tank Car maintenance and certification, and storage of spent fuel elements and other wastes.

The highest priority waste problem at Hanford is the High-Level Waste (HLW) Tanks. The 177 HLW tanks hold about 260,000 cubic meters of HLW, which represent about 200 million curies of radioactivity. Release of these materials could present significant hazards to workers, the general public, or the environment. Safety concerns and system deficiencies are being addressed to reduce potential health, safety, and environmental risks.

Since some tanks are known to have leaked in the past, most of the pumpable liquid has been removed and transferred to double-shell tanks. Completion of this activity is expected in 1996. In the past two years, Richland expanded activities related to reducing risks, including ferrocyanide mitigation, flammable gas and organic tank programs. Additional instrumentation was added to selected tanks to improve monitoring capabilities, further reducing risk.

2318

II. Funding Schedule - Richland (cont'd)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 29,976	$ 37,279	$ 15,811	$ -21,468	-58%
Facility Operations and Maintenance	375,796	332,128	281,472	-50,656	-15%
Hanford Waste Vitrification Plant	0	526	0	-526	-100%
New Facilities	434,138	308,399	167,744	-140,655	-46%
TOTAL, Richland	$839,910	$678,332	$465,027	$-213,305	-31%

III. Performance Summary

FY 1995 Accomplishments

- o Negotiated extensive changes to Tri-Party Agreement (TPA) to reflect significant schedule, cost, and technology advantages, and to improve the project strategy.
- o The 242-A Evaporator reduced HLW volume by 7.2 million gallons, which contributed to the decision to delay construction of new tanks.
- o Initiated and completed Phase I of the melter testing of LLW vitrification system to demonstrate the viability of vitrification as a suitable low-level tank waste treatment.
- o Began construction of Tank 106-C Retrieval process meeting TPA requirements.
- o Completed construction and initiated operation of 200- and 300-Area Treated Effluent Disposal Facilities, which meets TPA milestones.
- o Interim stabilization of 114 of 149 single-shell tanks (complies with Wyden Amendment).
- o Transported all 309 cesium capsules from IOTECH, Colorado, to Hanford.
- o $355M cost savings validated by major accounting firm.

FY 1996 Accomplishments (To Date and Planned)

- o Support safe operations and essential maintenance of tank farms.
- o Continue double-shell tank upgrade program to ensure safe storage of HLW and refurbishing the infrastructure that supports safe storage.
- o Implement revised tanks characterization strategy for safety issue resolution, tank farm operations, and disposal milestones.
- o Start hot operation of Effluent Treatment Facility, which will reduce the liquid volume in the double-shell tanks.
- o Support development and completion of draft and final Tank Waste Remediation System Environmental Impact Statements and Records of Decision.
- o Complete Final Safety Analysis Report for Tank Farms and Implement Safety Management System.
- o Complete construction of Waste Receiving and Processing, Module 1 facility.
- o Award radioactive mixed waste stabilization contract in support of TPA.

2319

III. Performance Summary - Richland (cont'd)

FY 1997 Planned Accomplishments - (cont'd)

o Complete resolution of safety issues for high-heat and ferrocyanide and continues addressing flammable gas and organic tank issues	$48,665
o Complete construction of Cross-Site Transfer Line, complete construction and begin operation of tank farm ventilation upgrades, maintain safe storage and RCRA compliance for high-level tank farm operations.	128,135
o Continue to accelerate characterization of tank waste in support of the TPA and DNFSB Recommendation 93-5	63,995
o Continue efforts on HLW pretreatment and tank waste storage and disposal	11,000
o Continue tank waste retrieval program for 177 underground storage tanks, which is necessary for treatment of waste	19,495
o Provide tank farm program management including support for baselining, ES&H activities, Tank Waste Remediation System-EIS, and systems engineering	33,869
o Start-up Waste Receiving and Processing Module (WRAP I) and support base operations of storage and disposal of low-level, mixed, TRU, and hazardous wastes	32,327
o Maintain minimum compliant operations and upgrades of liquid effluent treatment, storage, and disposal facilities	23,700
o Maintain minimum compliant operations of T-Plant decontamination and cleanout activities necessary for site-wide decontamination services	24,173
o Maintain analytical services including base funding for two on-site laboratories	37,500
o Support Hanford Environmental Management Program including TPA integration and RCRA Groundwater Monitoring, Air Monitoring, and Monitoring Well Maintenance Program Management	27,311
o Support PNL Waste Management, Surveillance and Maintenance	14,857
TOTAL, RICHLAND	$465,027

Explanation of Funding Change FY 1996 to FY 1997

- o Decreased funding reflects removal of Privatization from the Waste Management Program. ($50M)
- o Decreased funding reflects reduction to tank farm operations and maintenance and upgrades. ($45M)
- o Decreased funding reflects removal of support services from the Waste Management Program. ($23M)
- o Decreased funding reflects reductions in the Tank Waste Remediation System Program including LLW disposal, waste retrieval, program management, characterization, storage and disposal, and HLW programs. ($64M)
- o Decreased funding reflects reductions in the Solid Liquid Waste Program including liquid effluents, waste disposal, PNL activities, and WRAP I. ($31M)

2320

SAVANNAH RIVER

I. Mission Supporting Goals and Objectives

The Savannah River Site (SRS), located near Aiken, South Carolina, has produced nuclear materials for national defense purposes. As one of DOE's larger sites, it includes 5 nuclear reactors, 2 chemical separation plants, a fuel and target fabrication facility, a tritium processing facility, 2 high-level waste tank farms, a heavy water rework plant, the Savannah River Technology Center, low-level waste storage and disposal facilities, and a HLW treatment facility: the Defense Waste Processing Facility (DWPF). Savannah River has about 126,900 cubic meters of HLW in the form of liquid, sludge and salt cake. This volume represents about 630 million curies of radioactivity. Storage and treatment of HLW requires significant shielding and remote-handling capabilities.

The site also manages varying amounts of all other waste types. Progress is being made towards mission completion for all waste types. Approximately 1,600 m^3 of mixed low-level waste will be treated by a private vendor in FY 1997. Operations of the Consolidated Incineration Facility will be initiated in FY 1997. This facility is expected to treat Savannah river's current inventory of mixed waste as well as future mixed waste expected to be generated by the operations of DWPF. 2500 m^3 of low-level waste will be volume reduced and disposed on-site in FY 1997. Activities leading towards a decision on the preferred part for treatment of the TRU waste will be ongoing in FY 1997.

A HLW System Plan has been prepared to outline the strategy for safe and efficient management of SRS HLW. The HLW System Plan integrates management of existing and new facilities to stabilize HLW for final disposal and to empty storage tanks so they can be removed from service. Included in the Plan are operating constraints, planning base issues, assumptions, integrated schedules and contingency analyses. The Plan describes three near-term programs: 1) operation of two HLW evaporators to provide more available volume in the tank farms, 2) support/preparations for DWPF startup, and 3) startup of the In-Tank Precipitation (ITP) facility to provide feed for DWPF. Extended Sludge Processing (ESP) will continue to operate and provide feed for DWPF. Facilities are being constructed to remove liquid waste from storage tanks and provide it to ITP or ESP for processing. The ITP commenced operations in FY 1995. During FY 1995, startup testing at DWPF involving the use of simulated wastes has been completed and final preparations made for the start of radioactive operations in early 1996. Construction on the Replacement High-Level Waste Evaporator will continue in order to provide a reliable evaporation capability at the Savannah River Site, to avoid the need to build new tanks by concentrating dilute wastes, and to allow retirement of older evaporator systems. Challenges and uncertainties include the need to test and startup first-of-a-kind facilities, maintaining available waste storage space, increasing the processing rate and managing a highly-complex interdependent system.

During 1997 the DWPF will complete its transition from startup phase to operation. The full performance capacity of the DWPF is 400 canisters per year (80 percent of maximum capacity of 500 canisters per year). Experience gained during the operation of DWPF in FY 1996 will allow for a managed increase in canister production rate in FY 1997. Projected rates in FY 1997 are a range of 80 to 150 canisters. Over the next several years the production rate should approach the 400 canisters per year rate based on experience gained in FY 1996, 1997, and 1998.

2321

II. Funding Schedule - Savannah River (cont'd)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 6,548	$ 0	$ 0	$ 0	0%
Facility Operations and Maintenance	294,002	275,477	289,513	+14,036	+5%
New Facilities	78,613	71,924	53,922	-18,002	-25%
Defense Waste Processing Facility	235,769	184,755	141,945	-42,810	-23%
TOTAL, Savannah River	$614,932	$532,156	$485,380	$-46,776	-9%

III. Performance Summary

FY 1995 Accomplishments

Savannah River Site

- o Approved and started-up radioactive operations of the In-Tank Precipitation (ITP) facility.
- o Started-up the E Area LLW Disposal Vaults.
- o Issued Records of Decision for the DWPF Supplemental EIS.
- o Certified all on-site LLW Generators in accordance with Waste Acceptance Criteria of the E-Area Vaults.
- o Signed consent order with the state of South Carolina to implement the FFCA Site Treatment Plan.

Defense Waste Processing Facility

- o Initiated DWPF Waste Qualification Run testing phase.

FY 1996 Accomplishments (To Date and Planned)

Savannah River Site

- o Issued Record of Decision for the Waste Management EIS.
- o Will comply with the South Carolina Department of Health and Environmental Control (SCDHEC) on implementation of STP under the FFCAct.

2322

III, Performance Summary - Savannah River (cont'd)

FY 1996 Accomplishments (To Date and Planned)

Savannah River Site - (cont'd)

- o Started-up the New Waste Transfer Facility.
- o Continue operation of ITP, after resolution of technical issues, to provide precipitate feed for DWPF and tank space to support DWPF recycle and material stabilization.
- o Completed washing of sludge Batch #1a at Extended Sludge Processing to be fed to DWPF.
- o Begin demonstration of alternate waste removal techniques for salt in High-Level Waste Tanks.
- o Initiate development of Tank Closure Criteria.

Defense Waste Processing Facility

- o Commence DWPF radioactive operation, a critical milestone to the success of the HLW program.

FY 1997 Planned Accomplishments

Savannah River Site

o HLW/Solid Waste System Safe Operation (high-level waste, transuranic waste, hazardous waste, mixed low-level, low-level radioactive, and sanitary). Includes the following major activities: F & H Area Tank Farms; In-Tank Processing (surveillance and maintenance); F/H Effluent Treatment Facility; and Solid Waste Management Facility;	163,188
o Consolidated Incineration Facility Operation (perform trial burn, start operations, and treat of 1.2 million pounds of mixed low-level and low-level radioactive waste)	19,760
o Federal Facility Compliance Act commitments including completion of M-Area sludge vitrification and clean closure activities	21,579
o HLW System planned attainment including pretreatment and DWPF feed support (80-150 canisters per year). Includes the following Components: In-Tank Processing (pretreatment operations); High-Level Waste Removal From Filled Waste Tanks (93-D-187); Replacement High-Level Waste Evaporator (89-D-174); and Tank Farm Services Upgrade (96-D-403); complete closure activities on one HLW Tank	138,908
Subtotal, Savannah River	$343,435

III. Performance Summary - Savannah River (cont'd)

FY 1997 Planned Accomplishments

Defense Waste Processing Facility

o Safe operation and maintenance	65,250
o Continue radioactive operation of the DWPF in support of HLW system planned attainment	76,695
Subtotal, Defense Waste Processing Facility	$141,945
TOTAL, SAVANNAH RIVER	$485,380

Explanation of Funding Changes FY 1996 to FY 1997

Savannah River Site

- Increase in FY 1997 for Facility operations and maintenance is due to more emphasis on removing HLW from tanks and preparing it for treatment and improving the attainment of the HLW system.
- Reduction in New Facilities is due to full transition of the Consolidated Incineration Facility (CIF), a new facility, into operations and maintenance, and deferral of the next generation of LLW vaults, made possible by achieving greater volume reduction of LLW.

Defense Waste Processing Facility

- Decrease in FY 1997 funding is due to a reduction in start-up personnel and activities as DWPF completes the transition from the startup phase operation.

Major Issues

Savannah River Site

- Process safety issues in the In-Tank Precipitation Facility will require resolution prior to resumption pretreatment of one of the waste streams DWPF will vitrify.
- CIF startup has been delayed from FY 1996 to FY 1997 due to equipment problems and changes discovered during the pre trial burn tests conducted in early FY 1996.

2324

WASTE MANAGEMENT - DEFENSE

III. Performance Summary - Savannah River (cont'd)

Major Issues

Defense Waste Processing Facility

o Ability to ramp-up canister production rates consistent with production experience gained during startup of DWPF in FY 1996.

2325

HEADQUARTERS

I. Mission Supporting Goals and Objectives

Headquarters role is to determine and implement policy. This is done through the establishment of priorities and goals for the program, and then development of baselines to assist in determining progress on a given activity. Subsequently, headquarters assesses the adequacy of progress in order to report to Congress, interested stakeholders, and the public on the status of the waste management program.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Management	$ 43,602	$10,079	$ 4,846	$ -5,233	-52%
TOTAL, Headquarters	$ 43,602	$10,079	$ 4,846	$ -5,233	-52%

III. Performance Summary

FY 1995 Accomplishments

- o Provided Technical programmatic assistance to field for reviews of facility operations, safety analyses, and operational readiness review.
- o Developed and reviewed the first Baseline Environmental Management Report, which provides an assessment of the Department's environmental problems and options to resolve them.
- o Developed mixed waste treatment strategy with the States and EPA in accord with the FFCAct.
- o Performed waste operations analysis and strategic waste type planning.
- o Provided strategic planning and direction, independent evaluation and reviews, safety analysis, and developed systems engineering strategic plan for Hanford waste management operations.
- o Completed Defense Nuclear Facility Safety Board Recommendation 94-2 Implementation Plan.

2326

WASTE MANAGEMENT - DEFENSE

III. Performance Summary - Headquarters (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- o Will focus on providing expert policy development and analysis, develop accurate data to support strategic planning and macroanalysis.
- o Reduce support to field for the responsibility for facility operational readiness reviews, safety analysis, and other routine operational activities.
- o Continue to work with States and EPA to implement mixed waste treatment strategy.
- o Strategic Waste Type Planning will focus on 10-year planning horizon to ensure progress towards mission completion is made.
- o Will provide limited support to Hanford operations as Headquarters shifts routine activities and oversight to field.
- o Continue support, analysis, and coordination of DNFSB 94-2 Implementation Plan.

FY 1997 Planned Accomplishments

o Provide expert policy development and analysis.	
o Support Strategic Waste Type Planning and macroanalysis.	
o Coordinate and track progress of mission completion on all waste types	$4,846
TOTAL, HEADQUARTERS	$4,846

Explanation of Funding Changes FY 1996 to FY 1997

- o Reduction to Headquarters reflects management decision to focus on strategic, goal-oriented, planning, and shifting many routine operational activities to the field sites.

Major Issues

- o None

OFFICE OF WASTE MANAGEMENT
DEFENSE ENVIRONMENTAL RESTORATION AND WASTE MANAGEMENT
(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and Location of Project: Tank Farm Restoration and Safe Operations, Richland, Washington

2a. Project No.: 97-D-402
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 2nd Qtr. FY 1997

3b. A-E Work (Titles I & II) Duration: 90 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- None
Total Project Cost (TPC) -- None

4a. Date Physical Construction Starts: 1st Qtr. 1999

4b. Date Construction Ends: 3rd Qtr. FY 2005 a/

6. Current Cost Estimate:
TEC -- 248,480 b/
TPC -- 289,239 b/

7. Financial schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$ 7,584 b/		$ 7,584	$ 7,584

a/ Construction completion date corresponds to the current Tri-Party Agreement Milestone M-43-00, "Complete Tank Farm Upgrades." The actual construction completion date will be determined during conceptual design.

b/ The Total Project Cost and Total Estimated Cost values for the total project are rough order of magnitude based on extrapolations for the affected tank farm facilities developed from the detailed conceptual estimate for 241-AW Tank Farm Upgrades. These TPC and TEC valves will be verified or updated by the total project conceptual design cost estimate to be completed in April 1996.

2336

1. Title and Location of Project: Tank Farm Restoration and Safe Operations, Richland, Washington	2a. Project No.: 97-D-402 2b. Construction Funded

8. Project Description, Justification and Scope

The purpose of this project is to improve reliability of safety-related systems, reduce onsite health and safety hazards, reduce the risk of unmonitored releases to the environment, and support waste retrieval and disposal activities by restoring the existing Tank Farms facilities and systems. Numerous external audits and internal self-assessments of Tank Farms have revealed that the infrastructure requires extensive restoration in order to meet the overall Tank Waste Remediation System (TWRS) mission goals and support safe operation and maintenance activities.

The Tank Farm Restoration and Safe Operations Major System Acquisition (MSA) will provide capital improvements aimed at restoring the 200 Area Tank Farms to an acceptable design basis. The project focuses primarily on improvements needed for the double-shell tank (DST) farms with regard to instrumentation, tank ventilation, and waste transfer systems. The project also provides improvements to the overall Tank Farm infrastructure by providing electrical distribution upgrades for both DST and Single Shell Tank (SST) facilities. This MSA will be integrated with other planned/ongoing upgrades, waste retrieval, and major maintenance activities to ensure that the combined upgrades are performed in a cost-effective manner and that they will adequately support the overall TWRS mission.

The Tank Farm Restoration and Safe Operations MSA will provide major upgrades to Hanford's existing Tank Farm facilities in the following areas.

INSTRUMENTATION - All DST instrumentation systems will be refurbished, focusing on improving the overall safety, reliability, and efficiency of operations. In addition to replacing outdated and failed DST instrumentation, a new automated data collection system will be provided, which will replace the outdated Computer Automated Surveillance System (CASS). These upgrades will result in a significant reduction in the amount of manual readout field instrumentation in the DST farms, thereby improving worker efficiency and reducing worker staytime in the radiation zones (implementing an as low as reasonably achievable {ALARA} principle). No new SST instrumentation is planned to be provided by this project; however, selected existing SST instruments will be connected to the automated data collection system.

TANK VENTILATION - New tank ventilation systems will be provided to replace the existing ventilation systems associated with the following facilities:

- DST farms 241-AN, -AP, -AW, and -SY (primary and annulus system)
- DST farms 241-AY and -AZ (annulus systems only)
- SST farm 241-SX
- Double-contained receiver tank (DCRT) 244-A

2337

8. Project Description, Justification and Scope (continued)

The ventilation upgrades will improve worker safety and reduce the risk of radioactive and/or hazardous material releases to the environment by providing improved confinement and monitoring of tank emissions. New offgas treatment/filtration systems and effluent monitoring systems will be provided to ensure compliance with applicable Federal, State, and local emission standards.

WASTE TRANSFER - New waste transfer systems will be provided to support routine DST operations. New pipe-in-pipe transfer lines, equipped with appropriate leak detection and cathodic protection capabilities, will be constructed, ensuring that the DST waste transfer systems will be fully compliant with RCRA requirements and with Washington State regulations governing hazardous waste handling. (All SST retrieval-related waste transfer upgrades previously included in the scope of this project have been transferred to the TWRS Retrieval Program for implementation (change request documentation is currently being processed)).

ELECTRICAL DISTRIBUTION - The existing piece-meal electrical distribution systems servicing the Tank Farm complex will be consolidated into a single, integrated distribution system capable of supporting Tank Farm operations, as well as providing expansion capability for future loads from TWRS-related activities. The project will remove old, obsolete and/or failing equipment and will provide modern, efficient replacement components. Deteriorating power cabling will be replaced. Existing conditions, which have resulted in potential electrical hazards to personnel, will be corrected and the Tank Farms' electrical distribution system will be brought into compliance with current codes and standards. The electrical distribution system upgrades will begin at the existing utility interface points and will end at the actual loads in each of the Tank Farms. This scope includes replacement of a number of oversized/unused pole- and pad-mounted transformers with new centrally located substations. Maintenance of the system will be improved by the placement of electrical equipment in areas outside the contaminated zones. No new safety class power systems are planned as a part of this project.

Because of their age, many infrastructure systems and components have either exceeded their useful service lives and can be expected to fail in the near-term; have deteriorated beyond repair and must be replaced to ensure continued reliable operation; have already failed; or operate outside current environmental, health, and safety regulations. Due to the age and obsolescence of the existing equipment, it is often difficult to obtain replacement parts for failed or degraded components. These conditions, coupled with the problems associated with performing maintenance work in contaminated areas, have resulted in excessive operation and maintenance costs for the Tank Farm facilities. Deteriorating infrastructure and a poorly defined physical baseline could increase long-term operation and support costs and possibly limit the number of viable alternatives for retrieval, pretreatment and disposal of tank waste.

The FY 1997 appropriation will be used to initiate Title I design, Preliminary Safety Analysis Report development and project management activities.

2338

1. Title and Location of Project: Tank Farm Restoration and Safe Operations, Richland, Washington	2a. Project No.: 97-D-402 2b. Construction Funded

9. Details of Cost Estimate a/

	Item Cost	Total Cost
a. Design and Management costs		$ 7,584 b/
1. Engineering design and inspection at approximately XX percent of construction costs, Item c (Design, Drawings, and Specifications: ($ 0)	$ TBD	
2. Construction Management Costs	TBD	
3. Project management at XX percent of construction costs (item c)	TBD	
b. Land and land rights		0
c. Construction costs		TBD
1. Improvements to land	TBD	
2. Buildings	TBD	
3. Other structures	TBD	
4. Utilities	TBD	
5. Special facilities	TBD	
d. Standard equipment		0
e. Major computer items	0	
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance	0	
Subtotal		$ TBD
h. Contingencies at approximately XX percent of above costs		TBD
i. Total line item cost (section 12, a. 1. (a)		$ TBD
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$248,480

a/ Estimate data is currently available at a rough order of magnitude project cost summary only. The detailed estimate data will be included in the FY 1998 update to the project data sheet, following completion of the conceptual design.

b/ FY 1997 design costs only.

1. Title and Location of Project: Tank Farm Restoration and Safe Operations, Richland, Washington

2a. Project No.: 97-D-402
2b. Construction Funded

10. Method of Performance

The Tank Farm Restoration and Safe Operations MSA will be managed through the integrated management team approach. The U.S. Department of Energy, Richland Operations Office will have responsibility for project management. The integrating contractor responsibilities will be assigned to the Operating Contractor. A consolidated Architect Engineer/Construction Management (AE/CM) contract will be established with an offsite AE/CM team to accomplish definitive design, inspection, and construction management activities. Construction work in contaminated areas will be performed by the onsite engineer/constructor. To the extent feasible, construction in uncontaminated areas and procurement shall be accomplished by fixed-price contracts awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1997	Outyears	TOTAL
a. Total facility costs				
(1) Total facility costs				
(a) Line item (Section 10)	$ 0	$ 7,584	$ TBD	$ TBD
(b) Operating Expense Funded equipment	0	0	TBD	TBD
(c) Inventories	0	0	TBD	TBD
Total facility costs (Federal and Non-Federal)	$ 0	$ 7,584	$ TBD	$248,480
(2) Other project costs				
(a) R&D necessary to complete project	$ 0	$ 0	$ TBD	$ TBD
(b) Conceptual design costs	0	0	TBD	TBD

2a. Project No.: 97-D-402
2b. Construction Funded

11. Schedule of Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding (estimated life of project--XX years)

(1)	Facility operating costs	$ TBD
(2)	Facility maintenance and repair costs	TBD
(3)	Programmatic operating expenses directly related to the facility	TBD
(4)	Capital equipment not related to construction but related to the programmatic effort in the facility	TBD
(5)	GPP or other construction related to the programmatic effort in the facility	TBD
(6)	Utility costs	TBD
(7)	Other costs	TBD
	Total related annual funding	$ TBD

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

(1) Total facility costs

(a) Line item--These funds will be used for Title I design and project management support.

(b) PE&D--None.

(c) Expense-funded equipment--To be determined during conceptual design.

(d) Inventories--To be determined during conceptual design.

(e) Non-Federal Contribution--None.

(2) Other project costs

(a) R&D necessary to complete construction--None.

(b) Conceptual design--Conceptual design (including advanced conceptual design) will be completed at approximately $12,900,000.

(c) Decontamination & decommissioning (D&D)--To be determined during conceptual design.

(d) NEPA documentation costs--National Environmental Policy Act (NEPA) costs are conservatively estimated based on inclusion of the project in the TWRS-environmental impact statement process.

(e) Other project-related costs--These costs include engineering studies, systems engineering baseline development, project development, safety documentation preparation, regulatory permitting, site characterization and configuration control.

(f) Non-federal contribution--None.

1. Title and Location of Project: Waste Management Upgrades, Various Locations

2a. Project No.: 96-D-408
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 2nd Qtr. FY 1996

3b. A-E Work (Titles I & II) Duration: 29 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $42,570
Total Project Cost (TPC) -- $50,413

4a. Date Physical Construction Starts: 4th Qtr. FY 1996

4b. Date Construction Ends: 4th Qtr. FY 1999

6. Current Cost Estimate:
TEC -- $29,570
TPC -- $36,729

7. Financial schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1996	$ 5,615		$ 5,615	$ 4,350
1997	11,246		11,246	8,900
1998	8,200		8,200	9,050
1999	4,509		4,509	7,270

8. Project Description, Justification and Scope

This project line-item is the result of the FY 1996 Appropriation, in which Congress has provided greater flexibility to manage multiple projects of similar nature at various location. The subprojects will be addressed individually in the construction project data sheet, and must undergo the same review process as any other construction line item proposed in this budget. Since these changes occur on a real-time basis and cannot be anticipated, this consolidated line item approach will provide DOE the flexibility to react to significant technical, programmatic and regulatory changes that impact the individual subprojects, making the most effective use of the funds available.

2343

8. Project Description, Justification and Scope (continued)

a. Subproject #01 - Replace Industrial Waste Piping, Kansas City Plant

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEAR	CONSTRUCTION START - COMPLETION DATE
$2,400	$ 0	$ 0	$ 200	$ 2,200	$ 0	4th Qtr. FY 1997 3rd Qtr. FY 1998

This project will replace the overhead industrial waste piping system at the Kansas City Plant (KCP) including dilute acid, caustic, cyanide chrome, and industrial waste lines from the main manufacturing building and five other small buildings to the Industrial Waste Pretreatment Facility (IWPF). The project includes phased demolition and construction to replace the nine separate overhead industrial waste system pipe lines which together convey virtually all process wastes from the operating buildings to the IWPF. All of the pipe lines are located on an outdoor overhead pipe bridge. The new piping will be installed in the same location as the existing piping. Minor modification will be made to the existing bridge to strengthen the pipe anchor points to accommodate thermally induced loads. The total length of piping is approximately 6,700 feet.

FY 1997 funds will be used to perform Title II engineering, project management activities, and construction.

b. Subproject #02 - T-Plant Secondary Containment and Leak Detection Upgrades, Richland

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEAR	CONSTRUCTION START - COMPLETION DATE
$10,700	$ 0	$ 0	$ 2,100	$ 4,029	$ 4,571	3rd Qtr. FY 1997 - 2nd Qtr. FY 1999

The purpose of this project is to upgrade T-Plant facilities in order to perform decontamination activities in support of the Hanford Site's Waste Management and Environmental Restoration Programs.

T-Plant has been recommended for use as the primary interim decontamination facility in support of the Hanford Site's Environmental Restoration Mission and Waste Management Programs. This project will modify T-Plant facilities to comply with State of Washington and U.S. EPA environmental regulations for secondary containment and leak detection and to meet the needs of the facility's mission.

This project will provide a functional on-line facility to support major decontamination activities as required by the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) milestone M-32-03, "Complete T-Plant Tank Actions."

2344

1. Title and Location of Project: Waste Management Upgrades, Various Upgrades	2a. Project No.: 96-D-408 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The following upgrades will be provided by this project:

- Installation of a liquid waste collection, containment, leak detection, and transfer system for handling decontamination solutions in the 2706-T facility and 2706-TA facility;

The FY 1997 appropriation will be used to complete definitive design, finalize the preliminary safety analysis report (PSAR), initiate construction and procurement, and provide project management support.

c. Subproject #03 - Tank Farm Services Upgrades, Savannah River

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEAR	CONSTRUCTION START - COMPLETION DATE
$16,470	$ 0	$ 0	$ 3,315	$ 5,017	$8,138	4th Qtr. FY 1996 - 4th Qtr. FY 1999

The Tank Farm Services Upgrades project consists of improvements to three different areas of the Tank Farm. These improvements will include service piping upgrades in the H-Area Tank Farm (West Hill), Electrical upgrades in the F-Area Tank Farm, and a cooling system upgrade in the H-Area Tank Farm (East Hill). The upgrades to the service piping are necessary to support the continued and expanding tank farm operation. The cost of repairing leaks in buried pipes has been approximately $4 million over the past four years. Detecting and repairing the leaks is very difficult.

The electrical upgrades in F-Area will consist of the addition or replacement of automatic transfer switches (ATS) and cable which will correct the electrical low-voltage situation in the F-Area Tank Farm. Low voltage situations are causing power interruptions in the F-Area Tank Farm. This project will provide and install a new automatic transfer switch in 241-64F compressor house. The project will replace the overloaded automatic transfer switch in Building 241-74F. The existing normal power supply and load cables in Building 241-74F will be replaced. The standby source and cables will not be changed.

The cooling system upgrade will provide adequate cooling to support In-Tank Precipitation (ITP) and Extended Sludge Processing (ESP) which will feed Saltstone and Defense Waste Processing Facilities (DWPF). Due to changes in the site mission, the cooling requirements for the Tank Farm has changed. The new mission is to remove waste which will generate heat from slurry pump operation and tank transfers. The process facilities will require lower tank temperatures. To provide adequate cooling, a heat exchanger, and a new chromate cooling water pump will be added to the system. The existing cooling pumps will be upgraded.

2345

1. Title and Location of Project: Waste Management Upgrades, Various Upgrades	2a. Project No.: 96-D-408 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The mechanical services in the H-Area Tank Farm need to be replaced due to damage to the services caused by age. These upgrades are required to support the tank farm operations. This project will replace buried service piping in H-Area with piping in trenches or on pipe racks and provide three new gang valve assemblies with double contained steam supply. The new gang valve assemblies with double contained pipe to Tanks 35 through 37 will reduce the possibilities of back flow in the steam supply lines from occurring again. The assemblies will give better environmental control and implement the ALARA philosophy. The existing lines will be capped and abandoned in place. The gang valve house will be abandoned. The existing gang valve house (GVH) and steam transfer line are not in compliance with DOE Order 5820.2A "Radioactive Waste Management", and poses a threat to the environment and personnel.

FY 1997 funds will be used to continue Title I, Title II design, and procurement of engineered materials. The annual operating expenses for this facility is estimated to be $300,000.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Total cost of construction is $29,570,000.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal Contribution--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--$1,950,000 has been incurred to develop the conceptual design reports for Subprojects #01 through #03.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--National Environmental Policy Act (NEPA) activities and documentation are expected to cost approximately $5,000 for Richland.
      (e) Other project-related costs--Costs of approximately $5,214,000 for various project support activities, including value engineering session, site evaluation, project and quality assurance plans, design and quality assurance reviews, inventories for startup, readiness reviews, and health physics technician and plant personnel report.
      (f) Non-federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--Costs of approximately $2,852,000 for operations, maintenance, and utilities for the facilities provided by the Subprojects.
   (2) Facility maintenance and repair costs--None.
   (3) Programmatic operating expenses directly related to the facility--Includes T-Plant waste management, operational safety, facility operations, engineering procedures/drawings, waste assessments and rail car transfers.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--Costs of $450,000 for replacement parts.
   (5) GPP or other construction related to the programmatic effort in the facility--None.
   (6) Utility costs--None.
   (7) Other costs--None.

1. Title and Location of Project: Install Permanent Electrical Service for the WIPP Waste Isolation Pilot Plant, Carlsbad, New Mexico

2a. Project No.: 95-D-402

2b. Construction Funded

8. Project Description, Justification and Scope

The scope of the project changed due to a project upgrade from the Southwest Public Services (SPS) utility. This new upgrade will provide a technically superior 115 kilovolt (kV) electrical transmission line (south line) and substation as opposed to the previous project (north line) which would provide a 69 kV electrical system.

Project Elements: In addition to the continuance of operating the existing transmission line, this project includes the following main elements.

a. Approximately 19.0 miles of new wood-pole H-frame transmission line routed from Southwest Public Services (SPS) to OCHOA Sand Dunes substations to complete the transmission line loop to WIPP. As is the case with the existing line, the new line will be owned and operated by SPS.
b. A new 115/13.8 kV substation whose main elements include two Load Tap Change (LTC) power transformers each supplied with grounding resistors; 115 kV sulfur hexafluoride power circuit breakers; disconnect switches and buswork including 115 kV level insulators and steel support structures; protective relaying, instrumentation, control and auxiliary power equipment; 13.8 kV vacuum circuit breaker switchgear; a control building; and a perimeter security fence.
c. The addition of a 115 kV breaker terminal position and modification of protective relaying at SPS's Whitten Interchange.
d. Dual 13.8 kV cable circuits installed in underground utility corridor between the new SPS WIPP Substation and the existing 13.8 kV Plant Substation switchgear. Additionally, grounding, instrumentation, control and alarm cables between both substations will be installed. All such cabling will be owned by the Department of Energy and operated and maintained by the Management and Operations contractor.
e. Demolition of the existing 69/13.8 kV construction phase utility substation. Demolition will be under SPS responsibility.
f. Either access to the 13.8 kV vacuum circuit breakers equipment by authorized WIPP personnel or access to load interrupter switches and control of 13.8kV vacuum circuit breakers.
g. Installation of equipment to remotely monitor SPS's utility meter.

SPS's existing substation for the WIPP is supplied by one transmission line (single-fed). This substation was originally intended to be a temporary facility to support the Site Preliminary Design and Validation (SPDV) and construction phase of the WIPP project. Its replacement is necessary to meet WIPP's future power requirements such as providing sufficient electrical power, increasing electrical power reliability, improving quality of electrical power, and enhancing electrical safety. Attainment of these goals will assure the continuation of commercial electrical power should a single component fail.

2351

8. Project Description, Justification and Scope (continued)

Even though WIPP's aging temporary substation is considered adequate during WIPP's non-operational phases, it will prove inadequate during the operation phase, when higher loading is encountered and increased reliability is expected. For increased levels of reliability the existing temporary substation needs to be replaced and an additional transmission line installed. The original equipment was not designed for, nor does it supply the same level of reliability, associated operational-flexibility, or redundancy offered by the design for the permanent substation and new transmission line.

A reliable, redundant and flexible system would prevent outages at the WIPP due to a single-event, forced or maintenance-related outage. A single event due to equipment failure on either the existing transmission line or substation would shut the WIPP site down, the underground facilities would be evacuated, and only the equipment required to monitor the safe disposal of the waste would remain operable on site. A single event forced outage could be either momentary or for a long duration. According to SPS, sustained outages of 48 hours or more are possible for failure and emergency replacement of a "standby" substation transformer. Replacement of the transformer with other than an emergency replacement could take much longer. Likewise, loss of the transmission line could require or even exceed five days for repairs depending on the extent of damage.

Without completion of this project, controlled maintenance or construction outages for SPS utility equipment would also shut the WIPP site down. Periodically transmission lines and various equipment on the SPS system will need maintenance that may require such an outage. While less disruptive, even planned outages will have the same effects as an equipment failure.

Voltage sags and surges are a relatively common occurrence on utility power lines. The magnitude and effects of these sags and surges are normally greater on a single feed (radial) transmission system. A multiple feed (looped) transmission system will tend to absorb the sags and surges into the system and reduce the effect on the customer. Mine Safety and Health Administration (MSHA) requirements for under-voltage protection underground causes voltage sage to disconnect WIPP's underground electrical system. These MSHA requirements contribute to an increased likelihood for unnecessary loss of power to WIPP's underground due to voltage sags.

2352

1. Title and Location of Project: Install Permanent Electrical Service for the WIPP Waste Isolation Pilot Plant, Carlsbad, New Mexico	2a. Project No.: 95-D-402 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

Installation of an additional transmission line and a ring bus will help to alleviate the problem of these voltage excursions. With both lines connected, the additional line will act in such a manner to smooth out or damper either a voltage surge or a sag.

In its present configuration, the existing SPS utility substation requires 69,000 volt overhead transmission lines to cross over WIPP's perimeter security fence and over an area with both pedestrian and equipment traffic. This presents a potential safety hazard. While administrative controls in-place prevent certain equipment, such as WIPP's crane, from operating under the incoming transmission line, occasionally, heavy equipment is required to be used near or even under the transmission line.

Upon completion of this project the overhead transmission lines will be removed thereby eliminating an administratively controlled safety hazard.

2353

1. Title and Location of Project: Install Permanent Electrical Service for the WIPP Waste Isolation Pilot Plant, Carlsbad, New Mexico

2a. Project No.: 95-D-402

2b. Construction Funded

9. Details of Cost Estimate

Subtotal		$ 4,959
h. Contingencies at approximately 18 percent of above costs		906
New Mexico Gross Tax at 6.1 percent		77
i. Total line item cost (section 12, a. 1. (a)		$ 5,942
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC) b/		$ 5,942

a/ Contingency at 15% due to uncertainty in SPS supplied figures, final transmission line routing, and fluctuation in cost of raw materials.
b/ Cost reflects change due to escalation, new baseline costs from SPS, and removal of the M&O contractor fee.

1. Title and Location of Project: Install Permanent Electrical Service for the WIPP Waste Isolation Pilot Plant, Carlsbad, New Mexico	2a. Project No.: 95-D-402 2b. Construction Funded

10. Method of Performance

The Management and Operating Contractor (MOC) will prepare conceptual design, design criteria, review and furnish comments to the DOE on all Title I,II and III engineering documents prepared by Southwest Public Service (SPS). SPS will provide the construction management for the project. During construction, utility tie-in to existing facilities and performance of final acceptance testing will be performed by SPS personnel.

SPS will provide the Title I and II design engineering. SPS will provide Title III inspection for this project which includes providing oversight surveillance and reporting as outlined in the Project Execution Plan. MOC will be used on an as-needed basis for evaluation and approval for the critical equipment installation and startup of Title III. Engineering is to include studies, preparation of design, drawings, specifications, cost estimates, and contractor support.

SPS will provide all construction, procurement, erection, startup and testing of the facilities proposed by this conceptual design. Oversight surveillance, and technical evaluation of specified equipment, installation, startup and testing procedures will be provided by the MOC and approved by the DOE.

2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 1st Qtr. FY 1995

3b. A-E Work (Titles I & II) Duration: 9 months

4a. Date Physical Construction Starts: 3rd Qtr. 1996

4b. Date Construction Ends: 2nd Qtr. FY 1999

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $9,600
Total Project Cost (TPC) -- $9,850

6. Current Cost Estimate:
TEC -- $ 9,600
TPC -- $10,606

7. Financial schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1995	$ 1,000		$ 1,000	$ 526
1996	4,600		4,600	3,819
1997	200		200	291
1998	3,800		3,800	3,259
1999	0		0	1,705

8. Project Description, Justification and Scope

Solid waste disposal activities for DOE's Oak Ridge facilities must comply with existing Federal and State regulations. The construction of Areas II and III of Industrial Landfill-V (ILF-V) and the proposed improvements to Construction/Demolition Landfill-VII (C/DL-VII) are required to meet the solid waste disposal requirements of the DOE's Oak Ridge Reservation through the year 2010. The timely development of Area II of ILF-V is mandatory for uninterrupted operations of the Y-12 and K-25 Plants as well as that of the Oak Ridge National Laboratory (ORNL). Based upon current projections of waste generation, Area II must be operational by late fall of 1996 to prevent disruption of operations at all of the Oak Ridge facilities.

2358

1. Title and Location of Project: Industrial Landfill V and Construction/Demolition Landfill VII, Phase II, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee	2a. Project No.: 95-D-405 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

This project will provide the engineering design, permitting, and construction for the development of Phases II and III of industrial landfill V (ILF-V) and site enhancements to the construction/demolition landfill VII (C/DL-VII). Both of these landfills are located within the boundaries of the Department of Energy's (DOE's) Oak Ridge Reservation located in Oak Ridge, Tennessee. The initial phases of the landfills and all landfill support facilities were previously constructed as part of the Steam Plant Ash Disposal (SPAD) project (90-D-125). The 1990 project provides the infrastructure and initial operating areas for both landfills. This infrastructure includes access roads to the site, site utilities, and a facilities support building. The efforts proposed under this project will expand ILF-V and render C/DL-VII in a state of "readiness" for future development when required.

The project scope for ILF-V includes the development of Areas II and III, which encompass approximately five acres each. Area II has an estimated volume of approximately 225,000 cubic yards with a projected life of approximately 4.3 years, and Area III has an estimated volume of approximately 470,000 cubic yards and a projected life of 9 years. The ILF-V scope also provides for clearing, grubbing, minimal grading, and revegetating the site. Based upon the promulgation of RCRA Subtitle D requirements into the Tennessee Department of Environment and Conservation (TDEC) solid waste rules, composite liners for the bottom of the landfill will be required for the Areas II and III of ILF-V. Leachate collection and gas migration control systems will be provided. The design will include provisions to facilitate closure of landfill areas as they reach capacity; however, the costs of these closures will be funded at a later date and therefore are not included in the cost estimate for this project.

The project scope for C/DL-VII provides "capital" improvements to the site, including construction of a second sedimentation pond, completion of the landfill perimeter road, and clearing, grubbing, minimal grading, and revegetating the remainder of the site.

The phased development of ILF-V and the enhancements to the C/DL-VII are required to meet the future industrial wastes disposal requirements of DOE Oak Ridge Operations and to comply with the Resource Conservation and Recovery Act (RCRA), Subtitle D requirements that have been promulgated into the Tennessee Department of Environment and Conservation solid waste rules. The waste to be disposed at these sites is industrial waste or construction/demolition debris.

2359

1. Title and Location of Project: Industrial Landfill V and Construction/Demolition Landfill VII, Phase II, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee

2a. Project No.: 95-D-405

2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The generation of solid industrial wastes at Oak Ridge will continue as long as the plants operate. Additionally, refuse generation will continue through the remedial action and decommissioning and decontamination activities. Land-based disposal remains the best approach to solid waste management for the near future. This project has been planned with the most technically and economically acceptable waste management practices in mind. These technologies will meet the current and anticipated regulatory requirements. As with many projects that are borne out of environmental compliance issues, a significant area of uncertainty is future environmental regulations. The EPA has recently promulgated regulations that present a major impact on the design and cost of operation of sanitary landfills. The objective of this project is to provide a landfill that complies with the new federal regulations and the applicable state regulations and minimizes the costs of implementation.

The FY 1997 obligations will fund construction management and project management activities.

i. Total line item cost (section 12, a. 1. (a)		$ 9,600
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$ 9,600

a/ The cost estimate is based on a conceptual design completed in April 1993, at a cost of $118,000. The DOE Headquarters Economic Escalation Indices for Construction Projects were used as appropriate over the project cycle.

1. Title and Location of Project: Industrial Landfill V and Construction/Demolition Landfill VII, Phase II, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee	2a. Project No.: 95-D-405
	2b. Construction Funded

10. Method of performance

DOE-ORO will provide overall project management.

The facilities manager will provide project specific design criteria, construction support services (including design and project liaison, project management and construction support), and Title III field engineering services. To the extent feasible, engineering will be performed under a negotiated architect-engineer contract. The onsite construction manager will award and administer all construction contracts. Construction work will be accomplished by fixed-price subcontract(s) awarded on the basis of competitive bids.

2b. Construction Funded

11. Schedule of Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding (estimated life of project--13 years) a/

(1) Facility operating costs	$ 3,000
(2) Facility maintenance and repair costs	300
(3) Programmatic operating expenses directly related to the facility	0
(4) Capital equipment not related to construction but related to the programmatic effort in the facility	250
(5) GPP or other construction related to the programmatic effort in the facility	0
(6) Utility costs b/	25
(7) Other costs	0
Total related annual funding	$ 3,575

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

(1) Total facility costs

(a) Line item--Construction line item costs for the engineering, design, and construction are estimated to be $9,600,000.

(b) PE&D--None.

(c) Expense-funded equipment--None.

(d) Inventories--None.

(e) Non-Federal contribution--None.

a/ Annual funding estimates are preliminary and generally based on past operating experience of a similar facility.

b/ Utility costs are based on rough estimates. Equipment usage and related service costs will be further evaluated and subsequently updated.

2363

1. Title and Location of Project: Industrial Landfill V and Construction/Demolition Landfill VII, Phase II, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee	2a. Project No.: 95-D-405 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

(2) Other project costs
- (a) R&D necessary to complete construction-- None.
- (b) Conceptual design--The conceptual design was completed in April 1993 at a cost of $118,000.
- (c) Decontamination & decommissioning (D&D)--None.
- (d) NEPA documentation costs--No NEPA documentation costs are associated with this project. An Environmental Assessment (EA) was prepared at part of the SPAD project and a Finding of No Significant Impact (FONSI) was issued covering the entire landfill development site.
- (e) Other project related costs--Other project related costs include preparation of project-specific design criteria and facility engineer support.

(f) Non-Federal contribution--None.

b. Related annual funding
- (1) Facility operating costs--Include materials and labor to staff and operate ILF-V (including leachate collection system), leachate holding tank facility, C/DL-VII, and the landfill facilities building. The scope of this project does not replace any other facility, but adds additional capacity to existing facilities.
- (2) Facility maintenance and repair costs--Include non-construction maintenance effort and repair including maintenance of landfill facilities building, landfill equipment, leachate collection system, leachate holding tank facility, sedimentation ponds, perimeter roads, and surrounding area. Stormwater and erosion control are areas that require extensive on-going maintenance.
- (3) Programmatic operating expenses directly related to the facility--None.
- (4) Capital equipment not related to construction but related to the programmatic effort in the facility--Capital equipment needs not related to construction but related to the programmatic effort include periodic replacement of landfill operations equipment including motorized bulldozer/compactor to perform compaction and cover application, motorized scraper for providing and spreading cover material, motorized in-loader for use as back-up to compactor. Other support vehicles requiring replacement include grader, dump trucks, backhoe, vibratory roller and bulldozer.
- (5) GPP or other construction related to programmatic effort--None.
- (6) Utility costs--Annual utility costs include power, potable water, and sanitary water.
- (7) Other costs--None.

1. Title and Location of Project: Melton Valley Storage Tanks Capacity Increase, Oak Ridge National Laboratory, Oak Ridge, Tennessee

2a. Project No.: 94-D-404
2b. Construction Funded

8. Project Description, Justification and Scope

Presently, the MVST facility is filled to near capacity with liquid low-level waste which contains transuranic (TRU) waste. The existing MVSTs were built in 1980 to support ORNL's hydrofracture operations for disposal of Liquid Low-Level Waste (LLLW). Since the shutdown of the hydrofracture operations, ORNL has had no way to dispose of the LLLW generated. For the near-term, the LLLW supernate containing non-TRU constituents has been drawn from the tanks and solidified for on-site storage thus leaving large volumes of precipitate remaining inside the tanks. However, the on-site storage is limited and can be used only until permanent disposal is available.

Since a method does not exist for disposing of the LLLW generated at ORNL, the capacity of the MVST must be increased in order to continue operations. Additionally, the Federal Facility Agreement (FFA), which requires the transfer of waste from leaking, inactive, and substandard LLLW tanks, was recently signed by the Department of Energy (DOE), Tennessee Department of Environment and Conservation (TDEC), and the Environmental Protection Agency (EPA), increasing the need for additional storage capacity. New nominal storage capacity of 600,000 gallons is needed by 1998 in order to accommodate transfers required by the FFA, continue ongoing ORNL operations, and provide a safety margin for upsets and emergencies. Planned installation is in a modular format due to timing and funding constraints. The expansion is to be a storage facility and not a processing center. Capabilities for sampling of the waste will be provided.

The planned expansion will add six tanks, each with a maximum capacity of 100,000 gallons. One tank (100,000 gallons) will be kept empty as free reserve. The remaining five tanks will only be filled to 90 percent capacity, yielding a working capacity for the project of 450,000 gallons. The additional 600,000 gallons of capacity will provide for 170,000 gallons to be transferred from inactive, and substandard tanks; 150,000 gallons transferred from the Evaporator Facility; 130,000 gallons for future ORNL operations; 50,000 gallons of in-tank freeboard; and 100,000 gallons of reserve capacity. The new facility will be located in Melton Valley and will have the capability to transfer and receive liquids and readily pumpable sludges to and from the existing MVST Facility.

The following facilities will be provided:

a. Lined tank vaults containing six 100,000-gallon Liquid Low-Level Waste (LLLW) storage tanks. Each tank will provide a 10 percent free board space, leaving a useable capacity of 90,000 gallons each.
b. A lined vault adjacent to the tank vaults which provides confinement for the associated process pumps and valves.
c. A High Efficiency Particulate Air (HEPA) filtered ventilation system which maintains the tanks and vaults under negative pressure and prevents the buildup of combustible gases.
d. A buried and lined valve pit which connects the Melton Valley Storage Tanks-Capacity Increase Project (MVST-CIP) to the existing MVST facility and the LLLW Evaporator in Bethel Valley.

2366

1. Title and Location of Project: Melton Valley Storage Tanks Capacity Increase, Oak Ridge National Laboratory, Oak Ridge, Tennessee	2a. Project No.: 94-D-404 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

e. A truck unloading facility consisting of a diked concrete pad and piping connections capable of receiving chemicals from trucks and pumping liquid process waste into a process waste tanker.
f. A control and equipment room which houses support equipment required to operate the above facilities.

The funding for FY 1997 will be used to complete procurement and to complete funding of construction.

Total related annual funding	

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Construction line item costs for design, procurement, and construction of the Melton Valley Storage Tank Capacity Increase Project are estimated to be $48,000,000. This includes $200,000 for readiness reviews.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal contribution--None.
   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--The conceptual design was completed in April 1992 at a cost of $990,000. This included preparation of a Project Safety Assessment.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--Costs for NEPA documentation and activities are estimated to be $100,000.
      (e) Other project related costs--A total of $30,000 is included for site characterization activities. The Design Criteria was to be completed in September 1993, at an estimated cost of $540,000. Value engineering studies are estimated at $150,000. Other estimated costs of $3,000,000 include activities associated with requirements definition, project validation, readiness reviews, Project Management Plan, Quality Assurance planning and other miscellaneous supporting project documents.
      (f) Non-federal contribution--None.

2370

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding

(1) Facility operating costs--The annual estimated costs of $150,000 to operate the MVST-CI include personnel, operational sampling and analysis, health physics and industrial hygiene, and quality inspection.

(2) Facility maintenance and repair costs--$100,000 for maintaining the facility and making necessary repairs as required.

(3) Programmatic operating expenses directly related to the facility--The additional annual programmatic expenses of $100,000 includes the cost of personnel needed for performance tracking and reporting, and budgeting.

(4) Capital equipment not related to construction but related to the programmatic effort in the facility--Capital equipment in support of the MVST-CI is estimated to cost approximately $100,000 for replacement equipment and upgrades necessary to meet changing environmental, industrial safety, and health and safety requirements.

(5) GPP or other construction related to programmatic effort--Funding of $200,000 is required for GPP or other construction needed in routine facility operations and in order to keep up with changing requirements.

(6) Utility costs--$50,000 provided for cost of utilities.

(7) Other costs--Funding of $100,000 is for miscellaneous costs which are not covered above.

1. Title and Location of Project: Initial Tank Retrieval Systems, Richland, Washington	2a. Project No.: 94-D-407 2b. Construction Funded

7. Financial schedule (Federal Funds) (continued)

a/ Current total estimated costs, total project cost, and financial schedule are based on the Title I design for Tank 241-SY-101 and the conceptual design report for the other nine tanks.
b/ Reduction of $9,020,000 of FY 1995 current year funds for Productivity Savings, use of $6,000,000 of prior year funds for uncosted offset; reduction of $5,300,000 current year funds due to defense rescission.
c/ Reduction of $6,400,000 current year funds to meet uncosted offset for FY 1996.

8. Project Description, Justification and Scope

The Initial Tank Retrieval Systems (ITRS) project provides mixing and pumping systems for retrieval of radioactive wastes from ten of Hanford's 28 double-shell tanks (DST). The contents of these tanks consist of supernatant liquids and settled solids which must be mixed prior to transferring the waste to alternative storage or treatment facilities. The typical retrieval system consists of high horsepower electrically powered mixer pumps and associated control systems to mobilize solids in the tank. A new substation and underground duct banks will be provided for all but the AY/AZ complex. Internal tank components, such as thermocouple trees and dry wells, will be replaced with higher strength equipment to withstand the forces induced by the mixer pumps. Monitoring and control systems will be installed to measure performance of the mixer pumps and tank operation. Remote decontamination equipment and disposable containment equipment will be utilized for removal and disposal of tank and retrieval components. Dilution transfer systems will be installed for removal of the tank contents, and equipment will be provided as required to remove excess heat generated by the mixer pumps.

A preliminary tank retrieval sequence was developed in April 1992. It identified the tanks requiring retrieval to meet the immediate goals of resolving tank safety issues, supporting treatment operations, and managing tank space to accomplish this work. This retrieval sequence has been modified to reflect current Tank Waste Remediation System (TWRS) program needs, and now includes the following ten DSTs: 241-SY-101, 241-SY-103, 241-AN-103, 241-AN-104, 241-AN-105, 241-AN-106, 241-AP-101, 241-AW-101, 241-AY-102, and 241-AZ-102. The waste retrieval systems for these tanks will be provided by this project in three packages. The first package started design in FY 1994, and consists of tanks 241-SY-101, 241-AW-101, and 241-SY-103. Design of remaining tank waste retrieval systems will be pursued in packages starting design in FY 1999 and FY 2003.

2373

1. Title and Location of Project: Initial Tank Retrieval Systems, Richland, Washington	2a. Project No.: 94-D-407 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The ITRS will provide the capability required to remove the settled solids component of the waste for feed to future treatment plants. Existing equipment installed in the DSTs only allows the removal and transfer of supernatant liquids, and is incapable of suspending and removing the settled solids. A by-product of the retrieval function is the interim ability to consolidate tank waste by transferring the solids of one tank into another tank containing compatible waste. The additional DST storage space is required to allow safe storage of alternate waste streams, such as waste from the single-shell tanks. Additionally, the dilution and waste removal capabilities provided by ITRS will provide passive mitigation to waste that generates and retains flammable gas currently stored in six watchlist DSTs. The highest priority watchlist tank, 241-SY-101, is presently being mitigated by the operation of a mixer pump. Dilution of this waste will change the flammable gas retention capabilities such that it will no longer release gases at flammable concentrations. Once diluted, mitigation of the tank will no longer depend on continued operation of a mixer pump.

The FY 1997 appropriation will be used for procurement of long-lead equipment and half of the construction effort on the waste retrieval system.

i. Total line item cost (section 12, a. 1. (a)		$304,300
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$304,300

a/ Estimate is based on the Title I design for Tank 241-SY-101 and the conceptual design report for the other nine tanks.

b/ Tank 241-SY-101 costs include escalation based on the DOE-HW escalation study for 1995. Costs for the other nine tanks include escalation based on the Material and Labor Escalation Study, prepared by ICF Kaiser Hanford company, dated February 1994. Engineering: FY 1994 (3.8%); FY 1995 (4.2%); FY 1996 (4.2%); FY 1997 (4.5%); FY 1998 (4.5%); FY 1999 (4.9%); FY 2000 (4.5%); FY 2001 (4.4%); construction: FY 1994 (2.9%); FY 1995 (3.4%); FY 1996 (3.4%); FY 1997 (3.4%); FY 1998 (3.7%); FY 1999 (3.5%); FY 2000 (3.4%); FY 2001 (3.1%).

10. Method of Performance

The Initial Tank Retrieval Systems will be managed through the integrated management team approach. The U.S. Department of Energy, Richland Field Office will have responsibility for project management. The integrating contractor responsibilities will be assigned to the operating contractor. The research and development contractor will provide technical support. Design and inspection shall be performed by the onsite architect-engineer. To the extent feasible, construction and procurement shall be accomplished by fixed-price contract awarded on the basis of competitive bidding. Construction management will be performed by the onsite engineer-constructor.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1995	FY 1996	FY 1997	Outyears	TOTAL
a. Total facility costs						
(1) Total facility costs						
(a) Line item (Section 10)	$ 509	$ 3,151	$ 6,320	$10,400	$283,920	$304,300
(b) Operating Expense Funded equipment	0	0	0	0	0	0

11. Schedule of Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding (estimated life of project--30 years)

(1) Facility operating costs	$ 250
(2) Facility maintenance and repair costs	50
(3) Programmatic operating expenses directly related to the facility	0
(4) Capital equipment not related to construction but related to the programmatic effort in the facility	0
(5) GPP or other construction related to the programmatic effort in the facility	0
(6) Utility costs	0
(7) Other costs	0
Total related annual funding	$ 300

2877

1. Title and Location of Project: Initial Tank Retrieval Systems, Richland, Washington	2a. Project No.: 94-D-407 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--These funds will be used for design, procurement, construction, and project management.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal contribution--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--Supporting technology work of $800,000 includes a test loop for validation of waste transfer instrumentation.
      (b) Conceptual design--Conceptual design completed at a cost of $1,700,000.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--The W-211 NEPA documentation of $10,000 is integrated into the Hanford Defense Waste EIS, SIS-EIS, and TWRS-EIS.
      (e) Other project related costs--$51,390,000 provides for project definition, operating contractor support, site characterization, configuration verification and startup activities.
      (f) Non-Federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--An allowance of $250,000 has been included for operator time during the retrieval process and consumable materials required for operation of the system including dilution chemicals.
   (2) Facility maintenance and repair costs--A minimal allowance of $50,000 has been included for normal maintenance and repair.
   (3) Programmatic operating expenses directly related to the facility--None.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--None.
   (5) GPP or other construction related to programmatic effort--None.
   (6) Utility costs--Negligible.
   (7) Other costs--None.

3b. A-E Work (Titles I & II) Duration: 27 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $47,200
Total Project Cost (TPC) -- $52,700

4a. Date Physical Construction Starts: 1st Qtr. FY 1996

4b. Date Construction Ends: 4th Qtr. FY 1997

6. Current Cost Estimate:
TEC -- $47,200
TPC -- $52,700

7. Financial schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1993	$ 4,495		$ 4,495	$ 930
1994	6,500		2,600	1,186
1995	14,810	- 8,400 a/	10,310	3,362
1996	19,795	- 1,900 b/	17,895	29,822
1997	8,100		8,100	7,930
1998	3,800		3,800	3,970

a/ Use of prior year funds ($3,900,000) for uncosted offset and use of current year funds ($4,500,000) for Congressional rescission.
b/ Use of current year funds to meet uncosted offset for FY 1996.

2379

1. Title and Location of Project: Replacement of Cross-Site Transfer System, Richland, Washington	2a. Project No.: 93-D-182 2b. Construction Funded

8. Project Description, Justification and Scope

This project will provide a replacement piping system for the existing cross-site transfer system. The existing system does not conform to all current regulatory requirements for transporting radioactive liquid waste as defined in Department of Energy (DOE) Order 6430.1A, "General Design Criteria," and Washington Administrative Code 173-303-640. The replacement piping system will connect the 241-SY-A and B valve boxes in the 200 West Area SY Tank Farm to the 244-A lift station in the 200 East Area. The project will feature parallel, encased pipelines, remote leak detection, diversion boxes, vent station, and booster pump assemblies.

Six and one-half miles of encased, corrosion protected pipelines will be designed and installed to withstand design basis seismic events. Encased pipelines will be constructed of stainless steel inner pipe and carbon steel outer encasement. Leak detection devices and pressure testing capabilities will be provided for the encased piping. If there is a failure of the primary piping, leakage into the encasement will drain to, and be collected in diversion boxes and pumped to double-contained waste storage tanks or catch tanks, as required. Pipelines will be covered with adequate earth cover to provide radiation shielding, consistent with as low as reasonably achievable (ALARA) practices.

The key function of the project is to transfer for treatment and final disposal wastes including:

- o Plutonium Finishing Plant waste.
- o West Area single-shell tank waste.
- o Decontamination and decommissioning waste streams from T-Plant, U-Plant, and 222-S Laboratory.

Tri-Party Agreement milestones M-43-07-T01, "Complete Definitive Design," scheduled for August 1995; M-43-07A, "Start Construction," scheduled for November 1995; M-43-07B, "Complete Construction," scheduled for August 1997; and M-43-07C, "System Operational," scheduled for February 1998 will not be achieved if project is not funded. In addition, this project is required to support numerous other Tri-Party Agreement milestones (e.g., M-43-00, "Additional DST Storage Capacity," scheduled for December 1998; M-51-00, "Establish Milestones for Tank Waste Pretreatment," scheduled for December 2004; M-57-00, "Establish Milestones for Immobilization of High-Level Tank Waste," scheduled for December 2009; M-60-00, "Establish Milestones for Immobilization of Low-Level Tank Waste," scheduled for June 2005).

The FY 1997 request will be used to complete Title III design/inspection and construction. The funds will provide for onsite, offsite (fixed price), and operating contractors, and project management.

2380

1. Title and Location of Project: Replacement of Cross-Site Transfer System, Richland, Washington	2a. Project No.: 93-D-182 2b. Construction Funded

9. Details of Cost Estimate a/	Item Cost	Total Cost
a. Design and Management costs		$ 9,498
1. Engineering design and inspection at approximately 20 percent of construction costs, Item c (cost for design drawings and specifications $5,240)	$ 5,693	
2. Construction Management Costs	665	
3. Project management at 2 percent of construction costs (item c)	3,140	
b. Land and land rights		0
c. Construction costs		28,196
1. Improvements to land	2,670	
2. Buildings	0	
3. Other structures	1,455	
4. Utilities	2,240	
5. Special facilities	21,831	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
Subtotal		$ 37,694
h. Contingencies at approximately 25 percent of above costs		9,506
i. Total line item cost (section 12, a. 1. (a) b/		$ 47,200
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$ 47,200

a/ This estimate is based on Title I rebaseline documented on the approved change request (CR-058-021). New costs reflect changes through approved CRW058-037) and the preliminary 60% design complete working estimate.

b/ All costs include escalation for engineering and construction based on the "Hanford Material and Labor Escalation Study," prepared by ICF Kaiser Engineers Hanford Company, dated February 1993.

10. Method of Performance

Design and inspection will be accomplished by the onsite engineer/constructor (E/C) contractor. The majority of the construction effort will be performed by an offsite fixed-price contractor. Work in contaminated areas will be performed by the onsite E/C contractor. Reprogramming of existing microprocesses control systems or new control software shall be provided by the operating contractor. Jumper installation shall be performed by the operating contractor.

11. Schedule of Project Funding and Other Related Funding Requirements

	Previous Years	FY 1995	FY 1996	FY 1997	Outyears	TOTAL
a. Total facility costs						
(1) Total facility costs						
(a) Line item (Section 10)	$ 2,116	$ 3,362	$29,822	$ 7,930	$ 3,970	$ 47,200
(b) Operating Expense Funded equipment	0	0	0	0	0	0
(c) Inventories	0	0	0	0	0	0
Total facility costs (Federal and Non-Federal)	$ 2,116	$ 3,362	$29,822	$ 7,930	$ 3,970	$ 47,200

(4)	Capital equipment not related to construction but related to the programmatic effort in the facility	0
(5)	GPP or other construction related to the programmatic effort in the facility	0
(6)	Utility costs	0
(7)	Other costs	0
	Total related annual funding	$ 100

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Includes project management costs.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal contribution--None.
   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--Expense funds in the amount of $375,000 have been used for conceptual design, including preparation of a cost estimate and environmental documentation.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--$290,000; costs include preparation and support of the Action Description Memorandum and the Environmental Assessment.
      (e) Other project related costs--$4,835,000; including the cost of project support, the operational test procedure training and other startup costs, radiation monitoring, and initial decontamination at existing diversion boxes.
      (f) Non-Federal contribution--None.

a/ Change reflects modifications made to the Project Plan and design criteria from 35 to 50 year life.

1. Title and Location of Project: Replacement of Cross-Site Transfer System, Richland, Washington	2a. Project No.: 93-D-182 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding
   (1) Facility operating costs--None above the currently existing system.
   (2) Facility maintenance and repair costs--$100,000.
   (3) Programmatic operating expenses directly related to the facility--This project supports the overall permanent waste disposal mission at Hanford. No direct changes to this mission will occur as a result of this project.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--None.
   (5) GPP or other construction related to programmatic effort--None.
   (6) Utility costs--None.
   (7) Other costs--None.

Outyears	287,818		287,818	289,911

a/ Beginning with FY 1995 funding, as reflected in this project data sheet, this title and line item number will refer to a planned grouping of six subprojects. Those projects include the original line item, three previously Operating Expense funded projects, and two future projects.
b/ This includes the subprojects 01, 02 , 03, and 04. It does not include the TEC and TPC associated with the two future subprojects 05 and 06.
c/ Estimates are subject to Baseline Change Proposal approval, and revision for improvements from alternate waste removal techniques to reduce costs.
d/ FY 1994 Budget Amendment reallocation of $10,230,000 to reflect delay in project consolidation and reprioritization of subprojects.
e/ This represents the Operational Expense (OPEX) funded costs through FY 1994 of the three previously OPEX funded projects.
f/ Use of $1,700,000 current year funds for Productivity Savings and $2,150,000 for FY 1995 rescission.

2385

8. Project Description, Justification and Scope

The Waste Removal Program will provide, through a series of six subprojects, technical support, design, equipment, construction, and installation of waste removal facilities for all Type I, II, III and IV High-Level Radioactive Waste Tanks excluding those associated with the In-Tank Precipitation (ITP). A total of 47 waste tanks will be covered under this project. Facility modifications to allow processing of sludge prior to feeding to Defense Waste Processing Facility (DWPF) are included. In general, the waste removal facilities include slurry pumps, transfer pumps, transfer jets, structural support steel and associated instrumentation and distributed controls system (DCS). Each subproject will provide this equipment to allow salt and/or sludge to be removed and transferred to either ITP or Extended Sludge Processing (ESP) for eventual feed to the DWPF. Each of the subprojects will provide the facilities necessary to perform waste removal from the associated tanks. The waste removal process itself will be performed and funded by Operations. This project does not include Decontamination & Decommission (D&D) of the tanks.

The purpose of this project is for removal of waste which is essential for maintaining the DWPF operations to meet Federal Facilities Compliance Agreement (FFCA), waste processing commitments, and Savannah River Site commitments to minimize high-level liquid waste in storage, and to provide support for continued waste receipts. This project supports the FFA commitment to discontinue the use of waste tanks which do not provide adequate secondary containment (Type I, II, and IV tanks).

a. Subproject #01 - Waste Removal, Phase II, S-2081

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	Construction Start - Completion Dates
$307,050	$124,207	$ 7,700	$ 5,054	$ 6,710	$163,379	2nd Qtr FY 1980 3rd Qtr FY 2007

This subproject was previously an authorized operating expense funded project. This subproject provides modifications to existing equipment to improve monitoring and/or waste removal facilities on twenty-four existing Type I, II, and IV tanks.

This subproject supports the Federal Facilities Agreement (FFA) commitment to discontinue the use of waste tanks which do not provide adequate secondary containment (Type I, II, and IV tanks). The FY 1997 funds will support design and construction consistent with High-Level Waste System Plan.

S-2081 also provides three instrument and electrical control rooms, each with approximately 2,500 square feet of floor space. This project includes modifications to three Type III waste tanks to provide facilities to process sludge removed by all waste removal projects prior to being fed to DWPF.

8. Project Description, Justification and Scope (continued)

b. Subproject #02 - Type III Tank Salt Removal, Phase I, S-3291

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	Construction Start - Completion Dates
$ 47,800	$ 30,854	$ 4,500	$ 5,101	$ 5,247	$ 2,098	4th Qtr FY 1987 1st Qtr FY 1998

This subproject was previously an authorized operating expense funded project. This subproject provides for waste removal facilities for three Type III tanks and a new (approximately 5,000 sq. ft.) control room expansion of the existing F-Area control room. The FY 1997 funds will provide for the support of design and construction consistent with the High-Level Waste System Plan.

c. Subproject #03 - Type III Tank Salt Removal, Phase II, S-2860

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	Construction Start - Completion Dates
$106,500	$ 37,359	$10,175	$ 6,601	$ 8,043	$ 44,322	2nd Qtr FY 1990 2nd Qtr FY 2000

This subproject was previously an authorized operating expense funded project. This subproject provides for waste removal facilities for two Type III tanks. In order to support waste removal activities a new control room (approximately 15,000 sq. ft.) with a distributed control system facility (approximately 31,000 sq. ft.) will be provided. This subproject provides modifications to existing facilities on 17 Type III waste tanks, evaporators, and supporting facilities to improve waste tank monitoring and control.

The FY 1997 funds will provide for the support of design and construction consistent with the High-Level Waste System Plan.

d. Subproject #04 - Waste Removal Facilities, Phase III

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	Construction Start - Completion Dates
$103,700	$ 5,000	$ 300	$ 2,944	$ 0	$ 95,456	3rd Qtr FY 1996 4th Qtr FY 2008

8. Project Description, Justification and Scope (continued)

This subproject was the original scope for this line item. Previous TEC of $86,500,000 increased due to project extension to align with the High-Level Waste System Plan and to provide alignment of TEC/OPC accounting guidance. This subproject will provide for waste removal facilities for six Type III tanks in F- and H-Area Tank Farms. It also provides for caustic/inhibitor addition facilities for pH adjustment on tanks 35H, 36H, 37H. The FY 1997 funds will provide for the support of design and construction consistent with the High-Level Waste System Plan.

e. Subproject #05 - Type III Tank Waste Removal Facilities, Phase IV, FY 2005 New Start

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	Construction Start - Completion Dates
$ 0	$ 0	$ 0	$ 0	$ 0	$ 0	

This subproject provides for waste removal facilities for six Type III tanks in F- and H-Areas, and provides for infrastructure requirements to support waste removal. The TPC rough order of magnitude estimate is $125,000,000. This subproject will also provide modifications to 10 existing Type III tanks and supporting facilities to improve monitoring and control via a Distributed Control System.

f. Subproject #06 - Type III Tank Waste Removal Facilities, Phase V, FY 2008 New Start

TEC	PREV.	FY 1995	FY 1996	FY 1997	OUTYEARS	Construction Start - Completion Dates
$ 0	$ 0	$ 0	$ 0	$ 0	$ 0	

This subproject will provide waste removal facilities for the remaining three Type III tanks. The TPC rough order of magnitude estimate is $75,000,000.

k. Net Federal total estimated cost (TEC)		$565,050

a/ Cost estimate basis for subproject 04 is a completed Conceptual Design Report. Cost for subprojects 01, 02, and 03 are completed Title I estimates. Costs and schedule for subprojects 05 and 06 are not included in this estimate since these tanks are not scheduled for waste removal until after 2010, this will allow the estimates to incorporate all the actual cost, schedule and technical performance from earlier tanks resulting in estimates with less uncertainty.

2889

1. Title and Location of Project: High-Level Waste Removal from Filled Waste Tanks, Savannah River, South Carolina	2a. Project No.: 93-D-187 2b. Construction Funded

9. Details of Cost Estimate (continued) a/

The DOE escalation rates (% per year) used for this estimate are as follows:

Fiscal Year	FY 1993	FY 1994	FY 1995	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	OUTYEARS
Escalation	2.4	2.5	3.5	3.5	3.5	3.5	3.3	3.3	3.3

The above estimate includes $50,967,000 for escalation.

10. Method of Performance

Design will be performed by Bechtel Savannah River Design Engineering and a project engineering services contract or a fixed-price contractor for the Management and Operating (M&O) contractor at the Savannah River Site. Construction and procurement will be accomplished utilizing fixed-price subcontracts awarded on the basis of competitive bidding, where possible.

(5) GPP or other construction related to the programmatic effort in the facility a/	0
(6) Utility costs	0
(7) Other costs	0
Total related annual funding	$ 8,600

1. Title and Location of Project: High-Level Waste Removal from Filled Waste Tanks, Savannah River, South Carolina	2a. Project No.: 93-D-187 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Narrative not required.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal contribution--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--$800,000.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--None.
      (e) Other project related costs--Includes $262,388,000 costs to fund permitting activities, Post Modification Testing Reviews, one time program development startup, and operating contractor project support.
      (f) Non-Federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--Includes operating manpower, supplies and energy and additional operators. It is estimated that operation of this facility will result in a net annual cost increase of $6,100,000 and 56 FTEs. This facility does not replace an existing facility.
   (2) Facility maintenance and repair costs--$2,000,000.
   (3) Programmatic operating expenses directly related to the facility--Included in item one.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--$500,000.
   (5) GPP or other construction related to programmatic effort--None.
   (6) Utility costs--Included in item one.
   (7) Other costs--None.

1. Title and location of project: Replacement High-Level Waste Evaporator, Savannah River, South Carolina	2a. Project No.: 89-D-174 b. Construction Funded

8. Project Description, Justification and Scope

The Replacement High-Level Waste Evaporator (RHLWE) will provide the cost-effective waste concentration facility necessary for waste solidification programs at the Savannah River Site (SRS). The proposed facility is capable of removing 7.6 million gallons of water each year from the waste management complex after final processing through the existing Effluent Treatment Facility. Along with two other existing evaporators, it will be able to handle the additional volume of waste generated by the Defense Waste Processing Facility (DWPF) and associated waste tank farm processes.

The RHLWE will evaporate water from liquid, high activity radioactive waste so that less volume is needed for long-term storage. The Replacement High Level Waste Evaporator is needed to ensure that waste solidification operations including DWPF at the SRS are not limited by waste tank farm space. Space in the tank farms is currently being maximized by existing evaporators. The 242-2H evaporator is operational yet unreliable, and cannot process high heat waste from H Canyon. The 242-2F evaporator has been converted to process both high heat and low heat waste. The 242-1F evaporator has become unreliable, inefficient and is no longer operational. The 242-1H evaporator has been shutdown due to equipment failure. There are no plans to restart the 242-1F and 242-1H evaporators. The 242-2H, 242-2F evaporators, and RHLWE will be needed for the DWPF recycle, ESP washwater, and long term HLW system operation, particularly at attainments above those planned for Sludge Batch #1.

In yearly operating costs alone, the new evaporator can produce a significant cost savings. In addition, radiation exposure to personnel will be reduced by 30 man-rem per year, which represents about 80 percent of evaporator-related exposure. Future annual operating cost are anticipated to be $4,919,900 per year.

The H-Area Tank 32, an existing double walled waste tank, will be used as the feed tank. Four existing tanks (Tanks 29, 30, 31, and 37) will be used as concentrate receiver tanks. Underground lines from the new evaporator to the existing tanks will be provided by this project. Underground line to Tank 35 has been descoped through change control due to reduced future concentrate receiver tank space needs.

FY 1997 funds will be used to continue construction, including Tank 32 feed and return line installation, Tank 29 and Tank 30 gravity drain line installation, heating and ventilation (H&V) system installation (by subcontractor), cooling tower installation, and fire protection installation (by fixed price contract).

GCG

1. Title and location of project:	Replacement High-Level Waste Evaporator, Savannah River, South Carolina	2a. Project No.: 89-D-174 b. Construction Funded

11. Schedule of Project Funding and Other Related Funding Requirements (continued)

b.	Related annual funding (estimated life of project--30 years) a/	
(1)	Facility operating costs	$ 4,001
(2)	Facility maintenance and repair costs	918
(3)	Programmatic operating expenses directly related to the facility	0
(4)	Capital equipment not related to construction but related to the programmatic effort in the facility	0
(5)	GPP or other construction related to the programmatic effort in the facility	0
(6)	Utility costs	0
(7)	Other costs	0
	Total related annual funding	$ 4,919

a/ This cost and manpower is based on FY 1994 experience at the 242-2H evaporator. The cost has been escalated to FY 2001 dollars.

2397

1. Title and location of project: Replacement High-Level Waste Evaporator, Savannah River, South Carolina	2a. Project No.: 89-D-174 b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Narrative not required.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal Contribution--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--Activities necessary to improve process and equipment ($200,000).
      (b) Conceptual design--Includes preparation of a cost estimate for project authorization and preparation of the conceptual design package ($300,000).
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--Included in other project-related costs.
      (e) Other project related costs--Includes site characterization and NEPA, studies to optimize process and equipment, environmental permits, ORR, startup, testing, training, spare parts, equipment checkout and run-in assistance ($35,400,000).
      (f) Non-Federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--$4,001,000 includes operating manpower, supplies and energy. The base operation requires two operators (on a four-shift basis). It is estimated that operation of this facility will provide a net annual cost reduction based on the reduced operating (manpower, energy, supplies) cost obtained by retiring the 242-1F evaporator, and potential DWPF waste reduction. The RHLWE is a replacement facility and will require 29.2 full-time equivalents based on FY 1994 experience at 242-2H evaporator.
   (2) Facility maintenance and repair costs--$918,000 and 6.7 full-time equivalents based on FY 1994 experience at 242-2H evaporator.
   (3) Programmatic operating expenses directly related to the facility--None.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--None.
   (5) GPP or other construction related to programmatic effort--None.
   (6) Utility costs--None.
   (7) Other costs--None.

1. Title and Location of Project: Decontamination and Waste Treatment Facility, Livermore, California	2a. Project No.: 86-D-103 2b. Construction Funded

8. Project Description, Justification and Scope

This project has experienced a number of scope changes since it's inception. The original scope in FY 1986, consisted of a Liquid Waste Processing Facility, a Decontamination Facility, an operational Support Building, mechanical/electrical utility upgrades, and site preparation. The project was located in the southeast corner of the laboratory and the Total Project Cost (TPC) was $11,700,000. Between 1987 and 1990, the location of the site was changed to the northeast corner of the laboratory, due to the potential for seismic activity. The scope was increased to include a Solid Waste Processing Building, an incinerator and burn pan, a boiler and chiller plant, a Reactive Materials Building and a Storage Building. The TPC increased to $40,900,000. In 1990, the Lawrence Livermore National Laboratory Director adopted the recommendation of an internal laboratory panel to delete the incinerator and burn pan from the scope of the project due to public opposition. In 1993, a new baseline was approved which deleted the incinerator and the decontamination building, and added the Real Time Radiography Building, the Transuranic handling facility and the upgrade of Building 494 for mixed waste process development and engineering, increasing the TPC to $74,769,000. In 1993, DOE Oakland did an Integrated Waste Management Study which evaluated the waste management needs of LLNL and concluded that the scope of DWTF did not meet these needs. This resulted in the Alternative Design Review (ADR), which further evaluated the laboratory's waste management needs and compared various options for meeting these needs. The Baseline Change Proposal approved in January 1995, is based on the results of the ADR. This revised baseline represents the final path forward for the design and construction of the facility.

The scope is described in the Construction Project Data Sheet which follows. These changes were initially described in FY 1996 construction project data sheet.

This project will enhance, improve, and expand hazardous waste and mixed waste management at the Laboratory through the construction of approximately 115,500 square feet of new, state-of-the-art facilities for decontamination and waste treatment processes and mixed waste process development and engineering support. This project will provide new, centralized and integrated facilities for the Mixed Waste Management Facility (MWMF) and Hazardous Waste Management (HWM) operations that will meet the requirements for Low Hazards Category 3 Facility. Note that the equipment for the demonstration is not included in the TPC of this line item. The project will include the design and construction of new buildings on a nine-acre site located in the northeast sector of the Laboratory; it will share the site with existing HWM Building 693.

2400

1. Title and Location of Project: Decontamination and Waste Treatment Facility, Livermore, California	2a. Project No.: 86-D-103 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

A 1993 Waste Management study led to an Alternative Design Review which evaluated various options for meeting LLNL's waste management needs. The results of this study were incorporated into a Rebaseline Document (Conceptual Design level). The revised project scope is based on the Rebaseline Document published in November 1994. The Rebaseline Document also integrates the facility to house the Mixed Waste Management Facility demonstrations into the DWTF complex.

This project will provide new, centralized and integrated facilities for the MWMF and HWM operations that will meet the requirements for a Low Hazard Category 3 Facility. The project will include the design and construction of seven new buildings totalling approximately 115,500 square feet on a 9-acre site located in the northeast sector of LLNL, sharing the same site with existing HWM Building 693. It is anticipated that design and construction will be accomplished in five phases to meet project schedule and funding constraints. A brief description of project scope by phase follows.

Phase 1 - Site improvements. This phase includes debris removal, excavation, grading, trenching, electrical service, underground utilities, partial paving, curb and gutter, and sidewalks.
Phase 2 - MWMF. This phase consists of construction of the MWMF/Liquids Waste Processing Building (LWPB) building shell, and those facilities necessary to support the MWMF project. The Boiler/Chiller Building will also be constructed during this phase to provide utility services to the MWMF.
Phase 3 - DWTF. This phase consists of completion of the inside of the LWPB and the Boiler/Chiller Building and construction of the Truck Bay, Solid Waste Processing Building (SWPB), Reactive Materials Building, Chemical Exchange Warehouse/High Curie Waste Storage/Classified Waste Storage Building, and the Radwaste Storage Building.
Phase 4 - DWTF. This phase consists of construction of the Operational Support Building.
Phase 5 - Final site improvements. This phase consists of all remaining site work for the project, such as final grading, paving, parking facility, fencing, landscaping, and exterior lighting.

The proposed Decontamination and Waste Treatment Facility (DWTF) at LLNL will continue to meet the goals of LLNL's waste management program while significantly enhancing LLNL's waste management capabilities. Enhanced capabilities provided by the revised scope include the following: repackaging of radioactive, mixed and TRU wastes, decontamination and size reduction, treatment of mixed, reactive, sewer diversion wastes and proper storage of radioactive, mixed, hazardous and high-curie waste.

In addition to being in compliance with current and imminent regulatory requirements, the integration of the DWTF and the MWMF facility will provide safer and more cost-effective waste operations, restoration of lost capabilities, future mixed waste treatment capabilities, and, because all waste operations will be performed indoors, a significantly reduced risk of environmental impacts.

8. Project Description, Justification and Scope (continued)

In 1990, the RCRA land disposal restrictions become effective, prohibiting the land disposal of untreated hazardous and mixed radioactive wastes. DOE disposal facilities (such as the Nevada Test Site) that previously accepted untreated mixed wastes will no longer be permitted to accept such wastes. The proposed DWTF will be capable of treating a portion of land disposal restricted mixed and hazardous wastes.

a. Mixed Waste Management Facility/Liquid Waste Processing Building

The existing Liquid Waste Facility (514) is an old engine test building constructed in the 1940's for use by the U.S. Navy. The facility has been modified to process radioactive and hazardous liquid wastes through a single process line. Some of the present equipment and much of the present piping is deteriorated and requires expensive repair to maintain operations. The present location, which is separated from the other Hazardous Waste Management facilities, has insufficient space to allow for the additional expansion required to provide complying facilities. Due to the limited treatment technology employed, and excessive volume of end product that is produced it is difficult to solidify for disposal. The present radioactive and mixed wastes solidification building does not meet the ventilation, contamination and confinement requirements of DOE Order 6430.1A. Continuing maintenance and improvement has not alleviated the situation. In addition to the liquid waste processing systems, the new building will house the analytical laboratory, maintenance shop, a silver recovery facility, and the MWMF. MWMF will house a Pilot Plant which will evaluate technologies capable of treating mixed waste. The advantages of this facility included:

- o Siting the new facility in a location which meets the seismic requirement of RCRA and the State.
- o Providing sufficient treatment to assure meeting the new restrictive discharge limits established by regulators.
- o Providing more efficient technology to minimize disposal volume to comply with environmental regulations and DOE Orders.
- o Providing close capture ventilation and spill containment systems to comply with the environmental regulations which limit air emissions and prohibit liquid discharges to the environment.
- o Designing mitigative and preventive features to meet current requirements of DOE Orders and LLNL Health and Safety standards in accordance with the hazardous classification.
- o Consolidating the liquid waste operation into a centralized hazardous waste management facility which will optimize manpower and facility utilization.

2402

1. Title and Location of Project: Decontamination and Waste Treatment Facility, Livermore, California	2a. Project No.: 86-D-103 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

b. Waste Receiving, Classification, and Solid Waste Processing Building

Receiving and Classification Area

Receiving and classification is currently being performed in an open shed with limited space resulting in many containers being stored outdoors and the remainder receiving only minimal weather protection. There are no facilities to properly segregate incompatible wastes, and nothing to contain spills or container ruptures as required by RCRA, California hazardous wastes regulations, and DOE Orders. An open area is still used, although spills are contained, they would mix with rainwater. The new facility will provide the space necessary to receive, segregate, and store chemical and radioactive containers of all types and sized until the proper analysis and classification is completed and a determination made on the treatment, packaging and shipping methods required to properly prepare them for ultimate safe disposal. A work station will be included in the facility for maintaining incoming and outgoing shipping documentation and inputting data to the central computer through a terminal. The building will also house the personnel change and shower facilities.

Solid Waste Processing Area

Radioactive solid waste processing consists of packaging and compacting of low-level waste and TRU waste and is presently done in the Building 612, Dry Waste Facility which is seismically deficient and cannot meet the ALARA (As Low As Reasonably Achievable) requirements of DOE Order 6430.1A. Specific advantages of the new facility are:

- o Meeting the UBC and LLNL seismic requirements.
- o Increasing processing capability with safer handling and control.
- o Provides TRU size reduction, packaging, and container inspection capability.
- o Provides space for real time radiography (RTR) equipment to be transferred from another location.
- o Provides space for segmented gamma scanner or equivalent.
- o Designing mitigative and preventive features to meet current requirements of DOE Orders and LLNL Health and Safety standards in accordance with the hazard classification.

2403

8. Project Description, Justification and Scope (continued)

Container Washing Area

A container washing area will be included as part of the Waste Receiving, Classification, and Solid Waste Processing Building to provide adequate facilities for cleaning the non-radioactive waste containers and permit their reuse. This facility will assure compliance with the waste compatibility standards and container washing and rinsing requirements of RCRA and the DOHS.

c. Reactive Materials Building

Because the DWTF had to be relocated to the northeast corner of the laboratory, the existing Reactive Materials Building 614 cannot be used. A new facility will have to be constructed at the new DWTF site to store reactive waste and to house the process equipment which allows for the safe reaction and neutralization of small quantities of a large variety of highly reactive exotic gases and chemicals that offsite commercial disposers will not accept.

d. Storage Building

Radioactive Waste Storage Area

Radioactive and mixed wastes stored at the present Hazardous Waste Management site are stored outside exposing them to the weather. The radioactive waste storage area is required at the new DWTF in order to provide safe and compliant storage for radioactive and mixed wastes.

Clean Storage Area

It was intended to modify existing Building 612 to provide an enclosed storage area for clean containers, treatment chemicals, and supplies. Now that the DWTF site has been relocated away from the existing Hazardous Waste Management site, a new building must be constructed to provide the necessary protection needed to maintain new waste storage containers in good condition prior to use and to assure safe and proper storage for treatment chemicals and supplies.

2404

1. Title and Location of Project: Decontamination and Waste Treatment Facility, Livermore, California	2a. Project No.: 86-D-103 2b. Construction Funded

8. Project Description, Justification and Scope (Continued)

e. Operational Support Building

This facility will provide the following:

- o Central support for the four major operational functions; waste receiving and shipping, mixed aqueous waste treatment, solid LLW waste processing and storage.
- o Bring together the supervisory, administrative, technical support, and operational personnel currently housed in dispersed locations.
- o House the Hazardous Waste Management computer system for tracking hazardous waste and providing on-line information on waste material during emergency conditions.
- o Provide a training room to meet the requirements of 40 CFR 264.16 for training of personnel in handling hazardous waste.
- o Provide a centralized reference library for hazardous waste information.
- o Provide access control for DWTF/MWMF personnel and visitors entering and leaving the DWTF facilities.

f. Standby Generator

The standby generator is necessary to supply standby electrical power to critical facilities and operations in the DWTF during and following an earthquake. It must be invulnerable to damage to assure sustained electric power to equipment in the moderate hazard facilities which must continue to operate, i.e., ventilation, fire protection, and alarm systems, and also allow the safe shut-down of critical hazardous waste process systems.

i. Total line item cost (section 12, a. 1. (a)		$ 68,005
j. Non-Federal contribution		0
k. Net Federal total estimated cost (TEC)		$ 68,005

a/ The ED&I costs include the costs from the completed original design which cannot be used. These costs are unrecoverable.

2406

1. Title and Location of Project: Decontamination and Waste Treatment Facility, Livermore, California	2a. Project No.: 86-D-103 2b. Construction Funded

10. Method of Performance

Current estimate based on re-baseline cost estimate. Escalation is applied according to LLNL Cost Estimating Procedures and LLNL approved escalation rates. This project has been estimated with full overhead. LLNL and the Department of Energy Oakland Operations Office are in the process of reviewing the possibility of an incremental overhead rate for construction projects. Based on the approval of an incremental overhead rate, the actual rate applied may be less than the project was originally estimated.

Contracting arrangements are as follows:

Design will be on the basis of a negotiated architect-engineer contract. Major equipment requiring long-lead time will be purchased by LLNL early in the project on the basis of competitive bidding. To the extent feasible, construction will be accomplished by a fixed-price contract awarded on the basis of competitive bidding. Minor architect-engineering work and activation will be performed by LLNL forces.

b. Related annual funding (estimated life of project--40 years)	
(1) Facility operating costs	$ 1,165
(2) Facility maintenance and repair costs	1,003
(3) Programmatic operating expenses directly related to the facility	4,700
(4) Capital equipment not related to construction but related to the programmatic effort in the facility	400
(5) GPP or other construction related to the programmatic effort in the facility	200
(6) Utility costs	0
(7) Other costs	0
Total related annual funding	$ 7,468

a/ NEPA and Environmental Permitting costs are included in construction line item. Decontamination and Decommissioning will be funded by another project.

2408

1. Title and Location of Project: Decontamination and Waste Treatment Facility, Livermore, California	2a. Project No.: 86-D-103 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Narrative not required.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
      (e) Non-Federal Contribution--None.
   (2) Other project costs
      (a) R&D necessary to complete construction--Funding of $454,000 in this classification represents year R&D costs required to develop project and seismic criteria. Funding in this classification represents prior year R&D costs required to develop project and seismic criteria.
      (b) Conceptual design--Total funding of $315,000 in this classification represents the conceptual design cost and other studies determined to be necessary.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--None.
      (e) Other project related costs--None.
      (f) Non-Federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--Based on projected space recharge of $10.00 per square foot -- operating costs of the facility in 1999 are estimated to be $1,100,000 per year including escalation. The funds for these cost are a normal part of the past and current programs.
   (2) Facility maintenance and repair costs--Labor is estimated at 7.6 FTEs to support the operations at $132,000 per year for a total annual cost of $1,000,000. The funds for these people are a normal part of the past and current programs.
   (3) Programmatic operating expenses directly related to the facility--This estimate is for 30 Hazardous Waste Management operating and support personnel at $132,000 average per person in FY 1999 and for an estimated annual cost of $750,000 for chemicals, drums, pumps, spare parts, equipment replacement, etc. The operating funds for these people are a normal part of the past and current programs.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--This is an average annual estimate which includes both the small items needed for continuous operation of the facility and the occasional large item (over $200,000) which cannot be described at this time, but can be predicted as needed to maintain technical excellence in efforts conducted in the facility.
   (5) GPP or other construction related to programmatic effort--Initially no GPP costs are anticipated, but to keep abreast of technology, presently undefined alterations will likely be required in the future.
   (6) Utility costs--Included in the space recharge itemized in Facility operating costs.
   (7) Other costs--None.

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 4th Quarter FY 1991

3b. A-E Work (Titles I and II) Duration: 14 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $19,455
Total Project Cost (TPC) -- $20,280

4a. Date Physical Construction Starts: 1st Quarter FY 1998

4b. Date Construction Ends: 3rd Quarter FY 2000

6. Current Cost Estimate:
TEC -- $12,000 b/
TPC -- $12,825

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1992	$ 1,000		$ 1,000	$ 538
1993	0		0	125
1994	161	- 258 c/	- 97	240
1995	0		0	0
1996	0		0	0
1997	680		680	500
1998	2,000		2,000	2,000
1999	4,231		4,231	3,047
2000	4,186		4,186	5,550

a/ It should be noted that this project is justified as an operating expense funded construction project. It has been reformatted only to comply with the revised DOE Order 5100.3. It is not intended to be funded as a capital line item.

b/ The reduction from the previous TEC ($19,455) to the current TEC ($12,000) reflects the construction of the vault to one half (1/2) its original size.

c/ Reflects reduction/delays in funding due to change in need date.

1. Title and Location of Project: Defense Waste Processing Facility Saltstone Vault #2, Savannah River Site, Aiken, South Carolina	2a. Project No.: a/ 2b. Operating Expense Funded

8. Project Description, Justification and Scope

This project provides the design and construction of Vault #2 in the Z-Area saltstone disposal facility. The vault will be a concrete structure with approximate outside dimensions of 300 feet in length, 200 feet in width, and 25 feet in height. The interior of the vault will be divided into 6 cells which have approximate dimensions of 100 feet by 100 feet. The cells will be arranged into two rows of three cells. The cells will be filled with saltstone grout one at a time. The vault will have a permanent roof consisting of a combination of precast and cast-in-place concrete. Vault #2 will be built adjacent to, but not connected to, Vault #1.

This project will ensure that the Z-Area saltstone facility will continue to operate at designed production rates and fulfill its waste disposal commitments by providing an additional 1.4 million cubic feet of vault space. In order to fulfill this obligation, additional saltstone vault space must be provided by 1st quarter FY 2001. This additional vault space is required due to the projected In-Tank Precipitation (ITP) process startup and the continued salt waste flow rates to the facility from the Effluent Treatment Facility (ETF).

Saltstone is the end product of salt waste streams generated by the ETF and the ITP process. This waste is passed to Tank 50 in H-Area, and subsequently is combined with flyash, slag, and cement in Z-Area to make a cementitious grout which is pumped into large concrete vaults and allowed to solidify. The vaults are intended to provide the necessary diffusion barrier for the long term performance of the saltstone and provide weather protection until final closure. After a vault has been filled, it will be sealed by filling all of the void spaces with clean grout. This will constitute interim closure. Twenty to thirty years later, a final closure consisting of a clay cap and soil overburden will be constructed. The purpose of this final closure is to protect the vaults from rainwater infiltration by diverting the rainwater away from the vaults.

The purpose of this project is to ensure that the Z-Area saltstone facility will continue to operate at designated production rates and fulfill its waste disposal commitments. The Z-Area saltstone facility is scheduled to fill the existing vault space by the 4th quarter FY 2000.

This project will have negligible annual operating and maintenance cost.

FY 1997 funding will be used to complete Title II activities and start Title III activities.

e/ Reflects FY 1995 rescission of $2,000,000.
f/ TPC reduction reflects cost savings as the result of co-locating DWTF and MWMF. Originally, MWMF was to be housed in an upgraded, existing facility in another area of the laboratory.

1. Title and Location of Project: Mixed Waste Management Facility, Lawrence Livermore National Laboratory, Livermore, California

2a. Project No.: a/

2b. Operating Expense Funded

8. Project Description, Justification and Scope a/

This project is an operating expense funded construction project that includes Capital Equipment Not Related to Construction (CENTRC) funds for fabrication of capital equipment. It was reformatted only to comply with DOE Order 5100.3. It is not intended to be funded as a construction line item.

The scope of the Mixed Waste Management Facility (MWMF) is to design, construct, and startup a pilot-scale facility to demonstrate and evaluate the operation and integration of technologies for the treatment of low-level, organic, mixed waste; to demonstrate alternatives to the use of incineration; to demonstrate equivalency with applicable federal and state incineration-based standards; and to meet other Resource Conservation and Recovery Act (RCRA) Land Disposal Restrictions (LDRs), such as Universal Treatment Standards (UTS). The testing and evaluation will be performed in the MWMF/LWPB (Liquid Waste Processing Building). The building is currently undergoing Title I/II design activities under a separate line item, the Decontamination and Waste Treatment Facility (DWTF), 86-D-103. The separate line item will provide an operational infrastructure for the demonstration. Once the technologies are successfully demonstrated and sufficient data obtained, an appropriate permit application will be filed and the system will be transitioned for treatment of applicable LLNL waste streams (transitioning to treatment may require operational or physical modifications to equipment or relocation as required by the appropriate permitting plan to be determined at that time). This treatment is part of the LLNL Proposed Site Treatment Plan, in compliance with the Federal Facility Compliance Act (FFCA).

The primary treatment technologies selected for initial operations include Molten Salt Oxidation (MSO) and Mediated Electrochemical Oxidation (MEO). In addition to the primary process systems, the integrated facility will include ancillary systems, such as salt recycle for MSO and acid recovery for MEO, as well as process support systems (including receiving and shipping, feed preparation, final forms, offgas, water treatment, analytical services, and supervisory and local instrumentation and control).

a/ Due to higher priority activities, the scope, schedule and cost of the project are currently being evaluated and are not reflected in this data sheet.

2418

1. Title and Location of Project: Mixed Waste Management Facility, Lawrence Livermore National Laboratory, Livermore, California	2a. Project No.: g/ 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The MWMF Pilot Plant will support national DOE objectives, as well as the Waste Management objectives of the DOE-Oakland Operations Office and the laboratory.

- The MWMF is part of the response of the Laboratory and DOE to the FFCA, since the technologies evaluated in MWMF - after successfully demonstrated, permitted, and transitioned for treatment - will be used to treat applicable waste streams at LLNL and will be made available for deployment at other DOE, state and commercial sites.

- MWMF is being designed as an integrated demonstration facility, whereby the full treatment train for a given process technology is evaluated, optimized, and tested. This full treatment train involves not only the primary process system, but also includes ancillary systems (such as salt recycle for MSO and acid recovery for MEO) and process support systems (receiving, characterization, feed preparation, offgas, waste treatment, final forms, and instrumentation and control). In addition, NEPA, permitting, and other regulatory issues will be addressed. Industrial participation wherever practical is also a key objective, to provide commercial suppliers for specialized components.

- MWMF is designed as a pilot-scale facility, whereby engineering issues (such as lifetime, throughput, reliability, life-cycle costs, etc.) are addressed that are necessary for successful full-scale and/or commercial deployment of the technology.

- MWMF is being designed as a national testbed for evaluating mature, advanced technologies for treating low-level organic mixed wastes. After demonstration of the initial process technologies, new technologies will be selected for demonstration in MWMF, leading to full-scale deployment at other appropriate DOE and commercial sites. MWMF is also being designed with sufficient adaptability to evaluate a variety of waste streams of interest to DOE or commercial sites, to allow process optimization, and the introduction of new technologies into the treatment train.

- Engineering design data will be provided to the DOE community to feed into the design and construction of prototype or full-scale facilities. These data will include necessary engineering information related to plant design, NEPA and permitting guidance, operating data, applicable waste streams, systems analysis, process modeling, and technology transfer.

2419

1. Title and Location of Project: Mixed Waste Management Facility, Lawrence Livermore National Laboratory, Livermore, California	2a. Project No.: a/ 2b. Operating Expense Funded

9. Details of Cost Estimate a/b/

The costs shown are based on planned expenditures through 4th Quarter FY 1999. The current estimates are based on an initial functional design criteria which will be verified by an independent cost review. The following types of costs are associated with MWMF: system definitive design, conceptual design, equipment, fabrication, assembly, installation/checkout, NEPA/Permits, Safety Analysis, Operational Readiness Review, and project management. Cost for follow-on technology phases are not included.

	Item Cost	Total Cost
Phase I:		
Project Integration		$ 7,700
Criteria and Conceptual Design		2,200
Technology Development		36,200
Feed Preparation System	$ 8,800	
Waste Processing System	17,300	
Process Support System	10,100	
Project Support		4,400
Quality Assurance	300	
Public Participation	400	
Program Support	3,700	
Activation		5,200
NEPA/CEQA/Permit		1,600
Safety Analysis Report		400
Operational Readiness		2,000
Total Project Cost		$ 59,700
Phase II:		
TBD		TBD

a/ All costs for CENTRC-funded systems will be capitalized upon project completion.
b/ Due to higher priority activities, the scope, schedule and cost of the project are currently being evaluated and are not reflected in this data sheet.

2420

1. Title and Location of Project: Mixed Waste Management Facility, Lawrence Livermore National Laboratory, Livermore, California

2a. Project No.: a/
2b. Operating Expense Funded

10. Method of Performance

(a) Schedule of Planned Activities a/b/

Activity	Start	Complete
Criteria and Conceptual Design	3rd Qtr.FY 1993	3rd Qtr. FY 1994
System Design	4th Qtr.FY 1994	3rd Qtr. FY 1996
System Fabrication	4th Qtr.FY 1996	3rd Qtr. FY 1997
Operational Readiness (Initial Technology)	3rd Qtr.FY 1997	4th Qtr. FY 1998

(b) Management and Contracting

The project is managed for the Department by an onsite Project Manager, which reports directly to DOE-Oakland. The Project Manager's Office is responsible for the day-to-day management and decision making. Lawrence Livermore National Laboratory is responsible for executing the designs, fabrications, installation, and activities of the project. The project will be managed in accordance with DOE Order 4700.1 and other applicable DOE Orders.

System design will be performed by LLNL personnel. To the extent feasible, construction and procurement will be accomplished by fixed-price contracts and subcontracts awarded on the basis of competitive bidding. The majority of the work will be performed by LLNL forces.

(c) Current Year Achievements (FY 1996)

Complete Title II design, continue permitting activities, initiate long-lead procurement and start fabrication.

a/ Note that schedule has changed. The operational readiness will occur in FY 1998.
b/ Due to higher priority activities, the scope, schedule and cost of the project are currently being evaluated and are not reflected in this data sheet.

1. Title and Location of Project: Mixed Waste Management Facility, Lawrence Livermore National Laboratory, Livermore, California

2a. Project No.: a/
2b. Operating Expense Funded

11. Schedule of Project Funding and Other Related Funding Requirements

PHASE I:

Project Budget	FY 1993	FY 1994	FY 1995	FY 1996	FY 1997	FY 1998	FY 1999	Total a/
1. Operating Expenses	483	3,868	3,200	1,400	1,500	6,000	6,000	27,451
2. Capital Equipment	0	4,000	4,885	10,130	4,500	9,728	4,006	37,249
TOTAL	483	7,868	8,085	7,529	6,000	15,728	14,007	59,700

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--Narrative not required.
      (b) PE&D--None.
      (c) Expense-funded equipment--Includes CENRTC-funded project costs.
      (d) Inventories--None.
      (e) Non-Federal Contribution--None.
   (2) Other project costs
      (a) R&D necessary to complete construction--Engineering development costs included in equipment costs, since it supports design activity.
      (b) Conceptual design--Total direct costs for Conceptual Design Report and associated activities; does not include management and support activities.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--Contained in expense-funded project costs.
      (e) Other project-related costs--None.
      (f) Non-federal contribution--None.

a/ Costs are based on the Conceptual Design Report.

1. Title and Location of Project: Mixed Waste Management Facility, Lawrence Livermore National Laboratory, Livermore, California	2a. Project No.: a/ 2b. Operating Expense Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding
(1) Facility operating costs--Based on CDR estimate for operating staff and management and support staff.
(2) Facility maintenance and repair costs--Included in (1).
(3) Programmatic operating expenses directly related to the facility--Included in (1).
(4) Capital equipment not related to construction but related to the programmatic effort in the facility--Included in (1).
(5) GPP or other construction related to the programmatic effort in the facility--None.
(6) Utility costs--Included in (1).
(7) Other costs--None.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
(Changes from FY 1996 Congressional Budget Request are denoted with a vertical line in left margin.)

OFFICE OF WASTE MANAGEMENT
DEFENSE ENVIRONMENTAL RESTORATION AND WASTE MANAGEMENT
(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and Location of Project: Tank 241-C-106 Waste Sluicing, Richland, Washington

2a. Project No.: TANKSLUICING a/
2b. Operating Expense Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 3rd Qtr. FY 1993 b/

3b. A-E Work (Titles I & II) Duration: 21 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $47,300
Total Project Cost (TPC) -- $59,300

4a. Date Physical Construction Starts: 2nd Qtr. FY 1995

4b. Date Construction Ends: 1st Qtr. FY 1997

6. Current Cost Estimate:
TEC -- $47,212
TPC -- $59,212

7. Financial schedule (Federal Funds):

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1994	$16,700		$16,700	$16,700
1995	20,367		20,367	20,367
1996	10,033		10,033	10,033
1997	112		112	112

a/ It should be noted that this project is justified as an operating expense funded construction project. It has been reformatted only to comply with the revised DOE Order 5100.3. It is not intended to be funded as a capital line item.
b/ Construction schedule has returned to its original date due to delay in obtaining Funding of No Significant Impacts (FONSI) approval.

2424

1. Title and Location of Project: Tank 241-C-106 Waste Sluicing, Richland, Washington	2a. Project No.: TANKSLUICING a/ 2b. Operating Expense Funded

8. Project Description, Justification and Scope

This project will provide the systems, facilities, and utility upgrades required to retrieve the high-heat waste from single-shell tank (SST) 241-C-106. This project is operating expense funded because the expected operational duration is less than one year. Any equipment found to have residual value at the end of the retrieval demonstration will be capitalized at that time.

Tank 241-C-106 has been identified as a high-heat safety tank in accordance with Public Law 101-510 (Wyden Bill). This tank is fourth on the Priority I Safety Issues List at the Hanford Site, and has been selected for the demonstration of SST retrieval technology for Tri-Party Milestone M-45-03A. Tank-to-tank sluicing has been selected as the method to remove the high-heat waste from tank 241-C-106 and to satisfy retrieval requirements under the M-45-03A Milestone. The process selected for tank 241-C-106 is similar to the process used to retrieve waste from the A and AX Tank Farms in the 1970's. Once sufficient heat-generating sludge is removed, cooling water additions can cease.

The waste retrieval actions will comply with all applicable laws, regulations, and U.S. Department of Energy (DOE) Orders; and allow follow-on site closure actions.

The fiscal year 1997 funds will be used to complete project closeout activities.

2425

1. Title and Location of Project: Tank 241-C-106 Waste Sluicing, Richland, Washington

2a. Project No.: TANKSLUICING a/
2b. Operating Expense Funded

9. Details of Cost Estimate a/b/

	Item Cost	Total Cost
a. Design and Management costs		$ 18,812
1. Engineering design and inspection at approximately 61 percent of construction costs, Item c (Design, Drawings, and Specifications: $10,000)	$ 14,500	
2. Construction Management Costs	1,450	
3. Project management at 12 percent of construction costs (item c)	2,862	
b. Land and land rights		0
c. Construction costs		23,640
1. improvements to land	160	
2. Buildings	230

(5) GPP or other construction related to the programmatic effort in the facility	0
(6) Utility costs	0
(7) Other costs	3,600
Total related annual funding	$ 7,200

a/ This estimate is based on the latest approved change requests to the project 40 percent design cost.

1. Title and Location of Project: Tank 241-C-106 Waste Sluicing, Richland, Washington	2a. Project No.: TANKSLUICING a/ 2b. Operating Expense Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--None.
      (b) Expense-funded equipment--Funded one-step definitive design, process and construction: $47,212,000; this amount is adequate to cover one-step definitive design, process, inspection, procurement, construction and acceptance testing of the system.
      (c) CENTRC--$2,900,000; covers upgrades to existing operating facilities.
      (d) Inventories--None.
      (e) Non-Federal contribution--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--No conceptual design will be performed for this project.
      (c) Decontamination & decommissioning (D&D)--Decontamination and decommissioning following completion of retrieval operations will be performed and funded as a life-cycle cost item.
      (d) NEPA documentation costs--The National Environmental Policy Act (NEPA) documentation will cost approximately $110,000.
      (e) Other project-related costs--Safety documentation and permitting requirements, and startup activities will be performed at a current estimated cost of $8,990,000.
      (f) Non-federal contribution--None.

b. Related annual funding
   (1) Facility operating costs--$3,600,000; these costs include $3,400,000 for retrieval of the waste and $200,000 for operator training.
   (2) Facility maintenance and repair costs--None.
   (3) Programmatic operating expenses directly related to the facility: None.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility: None.
   (5) GPP or other construction related to the programmatic effort in the facility--None.
   (6) Utility costs--None.
   (7) Other costs--These costs are included in item 13.e(2)(f) above.

2428

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
DEFENSE ENVIRONMENTAL RESTORATION AND WASTE MANAGEMENT

(Tabular dollars in thousands, narrative in whole dollars)

TECHNOLOGY DEVELOPMENT

PROGRAM MISSION

The mission of the Technology Development Program is to provide new or improved technologies to reduce risks and the cost of cleanup at the Department of Energy (DOE) facilities and contaminated areas that have resulted from decades of weapons production. In some cases, there are no known methods by which to cleanup contamination, and the methods that do exist are often expensive or ineffective. To this end, the Technology Development Program conducts an aggressive national research and development program that addresses five major problem (or focus) areas identified by the Environmental Management (EM) program in FY 1994. This Technology Development budget is structured around these focus areas:

- Mixed Waste Characterization, Treatment, and Disposal to address the large inventory of mixed, low-level, and transuranic waste;
- Radioactive Tank Waste Remediation to address the hundreds of large storage tanks containing over 100 million gallons of radioactive waste;
- Contaminant Plume Containment and Remediation to address the uncontained hazardous and radioactive contaminants in soil and groundwater;
- Landfill Stabilization to address the migration and remediation challenges posed by numerous DOE landfills; and
- Decontamination and Decommissioning, to transition, decommission, deactivate and dispose of the aging and contaminated DOE weapons complex facilities.

In addition to the above focus areas, the Technology Development Program also conducts the following crosscutting and supporting programs to support the focus areas:

- Efficient Separations and Processing to develop technologies for extracting radionuclides and reduce waste volume;
- Characterization, Monitoring and Sensors to develop systems to accurately and safely characterize, monitor and analyze wastes;
- Robotics to reduce worker risk with remotely controlled robotic systems;

2429

PROGRAM MISSION - TECHNOLOGY DEVELOPMENT (cont'd)

- Technology Integration to establish processes to provide for early user, stakeholder, regulator participation and technology availability for use in cleaning up the DOE complex; and

- Industry and University Programs to ensure private industry and university participation in developing and implementing innovative technologies through Program Research and Development Agreements (PRDAs) and Research Opportunity Announcements (ROAs).

Of the seven recognized technology development stages: Basic Research, Applied Research, Exploratory Development, Advanced Development, Engineering Development, Demonstration and Implementation, Technology Development focus area efforts build from Applied Research through Demonstration to achieve implementation in partnership with private industry of high-payoff environmental technologies. Uncertainties are inherent in any research program, and the allocations of the funding requested in this document represent the best estimates at the time this budget was formulated. It is possible that, as events occur, priorities could change, and it may be necessary to redirect funds within the technology development budget areas.

The GOAL of the Technology Development Program is to focus the technology development activities on DOE's major environmental management issues while involving the best talent in DOE and national (public and private) science and engineering communities.

The OBJECTIVES associated with this goal are:

- To reduce cleanup costs
- To reduce risks
- To solve cleanup problems that currently have no solutions

In response to DOE's commitment to improve management practices and to adopt performance-based budgeting, the Technology Development Program tracks

PERFORMANCE MEASURES in these areas:

- Number of improved technologies/systems (bench, pilot, or full scale) demonstrations in the five focus areas and crosscutting programs;
- Number of improved technologies/systems available for transfer in the five focus areas and crosscutting programs;
- Percentage of technology development budget directed to the private sector to enhance ultimate commercial availability of technologies for site cleanup and waste treatment selection.

Technology Development Performance Measures Summary

FY 1997 PERFORMANCE MEASURES						
Performance Measures	Mixed Waste Target	Tanks Target	Plumes Target	Landfills Target	Facility D&D Target	Total Target
50-01 Number of Improved Technologies/Systems Demonstrated	14	20	28	27	13	102
50-02 Number of Improved Technologies/Systems Available for Transfer	6	6	10	8	2	32
50-04 Percentage of Technology Budget Directed to the Private-sector	50% $35.6M	35% $16.4M	50% $19.7M	50% $16.9M	50% $9.8M	47% $98.4M

Note: Program Support is not included in the values shown above

TECHNOLOGY DEVELOPMENT

PROGRAM PERFORMANCE SUMMARY

Mixed Waste Characterization, Treatment, and Disposal

- Provide acceptable treatment systems, capable of treating DOE's mixed waste, which have been developed in partnership with users and with continual participation of stakeholders, tribal governments, and regulators.
- Identify deficiencies in the critical path of the treatment systems specified in the Site Treatment Plans (STP) that was required under the Federal Facility Compliance Act and develop technologies to fill these gaps enabling DOE to meet its commitment to the regulators and stakeholders to treat and dispose mixed wastes.
- Enable the operation of complete treatment systems by developing subsystem technologies and providing bounding operation and performance data in the following areas:

  - primary thermal (Plasma, Joule heating melters, Molten Metal, Vortex, Microwave Melter, and Russian cold wall melter) and non-thermal (micro/macro polymer encapsulation, catalytic oxidation, supercritical CO2 extraction) waste destruction and stabilization technologies that can accept wide range (targeting 90 percent) of mixed waste;

  - close loop and continuous on-line off gas monitoring and treatment for organics, metals, and radionuclides;

  - ancillary technologies such as mercury stabilization and removal, materials sizing and handling, non-intrusive waste drum characterization, waste form performance etc., radionuclide partitioning, refractory performance, salt/ash stabilization; and

  - integrate the subsystem technologies to provide complete treatment systems.

- Make available technologies to drive competition in support of mixed waste treatment performance based contracts.
- Eliminate waste streams through demonstration/treatability studies where possible.
- Work with regulators and stakeholders (e.g. National Technical Workgroup on Mixed Waste and Western Governors' Association) to gain ultimate acceptance of the treatment technologies.
- Transfer technologies to industry for commercial use and application to DOE sites, identify opportunities to retrofit existing projects with more effective technologies.
- Accept and demonstrate technologies from the Crosscutting, Private Industry, and University Programs.

2443

Radioactive Tank Waste Remediation

- Manage a user-driven, technology development program that results in the closure of radioactive waste tanks while minimizing life-cycle costs.
- Transfer to user, systems to improve the accuracy, safety, and speed of tank waste analysis in hot cells at Hanford.
- Deploy technologies to characterize tank waste in situ, inspect tanks, and monitor tank leaks to support safety analyses and retrieval operations.
- Demonstrate and transfer, three Light Duty Utility Arm systems for the deployment of characterization and retrieval technologies in Hanford, Oak Ridge and Idaho tanks.
- Deploy and transfer, high pressure, water-jet technology to retrieve both bulk waste and tank heels from Oak Ridge, Idaho, and Savannah River.
- Implement and transfer technology to separate solids and liquids to both reduce High Level Waste (HLW) volume and to improve efficiency of waste processing.
- Develop and transfer radionuclide (cesium, strontium, and technetium) extraction technologies to reduce the volume of HLW requiring vitrification.
- Commence the Hanford Tank Farm Initiative. Develop and deploy characterization and retrieval technologies that will close two single-shell tanks in four years.
- Accept and demonstrate technologies from the Crosscutting, Private Industry and University Programs.

Contaminant Plume Containment

- Conduct full-scale demonstration and implement reactive barrier system at Oak Ridge Y-12 and Hanford N-Springs for in situ treatment of heavy metal contaminated groundwater.
- Adaptation and implementation of solution mining technology for enhanced uranium recovery from groundwater at Fernald resulting in significant cost savings.
- Demonstrate the capability to treat dense non-aqueous phase liquid (DNAPL)-contaminated soil and groundwater in situ and control plume migration using recirculating wells and passive treatment systems.
- Reduce site characterization costs for volatile organic compounds/DNAPLs, metals and radionuclides by 50 percent through the use of innovative tracers, geophysical, and chemical tools.
- Minimize secondary waste associated with DNAPL remediation through the development of separation, recovery, recycling, and destruction technologies.
- Facilitate the acceptance, approval, transfer, commercialization, and implementation of Contaminant Plume Containment technologies and systems, including applicable technologies from the crosscutting, private industry, and university programs.

2444

PROGRAM PERFORMANCE SUMMARY - TECHNOLOGY DEVELOPMENT (cont'd)

Landfill Stabilization

- Demonstrate the ability to contain/stabilize 90 percent of source terms at DOE's contaminated sites to prevent further migration by January 1997.
- Demonstrate the ability to treat 90 percent of the retrieved wastes from DOE's landfills by October 1997.
- Give equivalent priority to characterization, verification and monitoring, and retrieval technologies that directly support containment, stabilization, and treatment technology systems.
- Accept and demonstrate technologies from the Crosscutting, Private Industry and University Programs.
- Facilitate the acceptance, approval, transfer, commercialization, and implementation of Landfill Stabilization technologies and systems.

Decontamination and Decommissioning

- Demonstrate improved technologies and systems to solve customer identified needs to decontaminate and decommission DOE's radiologically contaminated surplus facilities and their contents, and to facilitate the acceptance, approval, transfer, commercialization, and implementation of these technologies.
- Emphasize demonstration and implementation of private sector technologies.
- Three large-scale demonstrations will be completed by the end of CY 1997.
- Five more large-scale demonstrations will be completed by the end of CY 1999.
- By the end of FY 2000 the Focus Area will provide technologies, systems, and methodologies to provide capabilities to D&D 90 percent of surplus facilities and materials.
- Technologies are needed to:

  - characterize and deactivate
  - survey and maintain
  - decontaminate and dismantle
  - dispose and recycle materials

- Emphasize, within near-term of 12-18 months, technologies for deactivation, surface decontamination, reuse of bulk contaminated materials, and remotely operated dismantlement systems.
- Emphasize, within mid-term of 3 years, technologies for remotely operated surveillance and maintenance systems, characterization and decontamination of bulk-contaminated materials, and facilitate adoption of free release standards for bulk-contaminated materials.
- Accept and demonstrate technologies from the Crosscutting, Private Industry and University Programs.

2445

TECHNOLOGY DEVELOPMENT

TREATMENT AND REMEDIATION TECHNOLOGY SYSTEMS

MIXED WASTE CHARACTERIZATION, TREATMENT, AND DISPOSAL

I. Mission Supporting Goals and Objectives

Site Treatment Plans identified 175,000 cubic meters of mixed waste in storage that includes over 1,400 mixed waste streams at 40 sites. In addition, 181,000 cubic meters of mixed low-level waste and transuranic waste is estimated to be generated over the next 5 years. The mission of this Focus Area is to provide acceptable treatment systems, capable of treating DOE's mixed waste, which have been developed in partnership with users and with continual participation of stakeholders, and tribal governments and regulators.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Mixed Waste Characterization, Treatment, and Disposal	$29,629	$51,152	$56,290	$5,138	10%

III. Performance Summary

FY 1995 Accomplishments

- Demonstrated catalytic extraction (Molten Metal) treatment technology on an actual Oak Ridge waste stream supporting the EM Office of Waste Management Privatization Initiatives.
- Completed the pilot-scale demonstrations of a primary thermal treatment system, vitrification, using non-radioactive surrogate mixed waste; designed and conducted an integrated field-scale vitrification system to be implemented at Oak Ridge in FY 1996 using actual waste.
- Demonstrated low-temperature thermal desorption technology using real waste at pilot-scale by removing organic contaminants in actual mixed waste at Rocky Flats and, thereby, allowing this site to meet the compliance agreement for organic contaminated combustibles.
- Bench-scale demonstration of Mercury removal with Potassium Iodide/Iodine (KI/I_2) leaching.
- Bench-scale demonstration of supercritical carbon dioxide extraction.

III. Performance Summary - Mixed Waste Characterization, Treatment, and Disposal (cont'd)

FY 1995 Accomplishments

- Demonstration and commercialization of polymer macro encapsulation system.
- Full scale demonstration of microwave solidification which decreases potential for worker exposure to radioactivity.
- Initiated development of a capture, test and release off-gas system with associated monitoring and process control hardware to eliminate the potential for toxic emissions from thermal processes.
- Demonstrated three prototype systems for on-line, real-time continuous monitoring of thermal system off-gas streams using actual PHP off-gas. The testing included laser spark and laser-induced breakdown spectroscopies for metals detection and the large-volume flow-through alpha detector for monitoring alpha-emitting radionuclides.
- Completed bench-scale tests of catalytic chemical oxidation (DETOX) process, a key non-thermal treatment system, and initiated pilot-scale development.
- Designed and assembled in conjunction with Russian scientists, a cold wall melter for demonstration in FY 1996.

FY 1996 Accomplishments (To Date and Planned)

- Complete site needs surveys and review Site Treatment Plans under the Federal Facility Compliance Act for the establishment of the technical baseline to determine technical deficiencies and use them to develop a needs based customer driven program.
- Complete the commercialization of the polymer macro encapsulation (non-thermal) technology at Envirocare and treat actual DOE lead contaminated mixed waste at 26 DOE sites.
- Continue primary thermal treatment technology development using radioactive waste including: Plasma Hearth Process, Vitrification Process, Cyclone Melting System, microwave, and Russian cold wall melter.
- Develop non-thermal technologies including micro polymer encapsulation, Delphi Detox, and supercritical CO2 extraction.
- Develop off-gas systems for on-line, real time, continuous monitoring of organics, metals and radionuclides including real time alpha monitor, cyclone melter system, and mercury vapor removal. Also developing off-gas close loop capability to contain and monitor toxic substances prior to its release.
- Initiate development of treatment system deficiency technologies including a non-intrusive waste container survey.
- Conduct life-cycle cost analyses to support performance based contracting.
- Work with regulators and stakeholders (National Technical Workgroup on Mixed Waste and Western Governors Association) to gain acceptance of the technologies under development.

FY 1997 Planned Accomplishments

- Complete Primary Thermal Treatment Technologies: Complete demonstration and provide performance data for plasma hearth process, thermal desorption and transportable vitrification, cold wall melter and cyclone melter ..... $ 8,900

III. Performance Summary - Mixed Waste Characterization, Treatment, and Disposal (cont'd)

FY 1997 Planned Accomplishments (cont'd)

- Non-Thermal Technologies Development: Develop non-thermal systems including, nitrate removal, cyanide destruction, trace metal removal, supercritical carbon dioxide extraction, and fission product removal; complete polymer macro encapsulation, and implement base hydrolysis at Pantex 10,800
- Off-Gas Monitoring Technologies: Develop volatile organic compound and toxic metals monitoring subsystems 3,200
- Continue Treatment System Deficiencies Development: Develop subsystems to address deficiencies in treatment systems including, mercury monitoring, stabilization and removal; non-intrusive waste characterization, material sizing, separation and handling, salt and ash stabilization, alpha monitoring, and internal drum pressure measurement; and implement Russian technologies 25,690
- System Performance Evaluation: Evaluate systems performance for radionuclide partitioning, waste form performance, HEPA and mercury filter performance, and molten product removal; develop life-cycle cost analyses to support funding decision and performance based contracting 3,200
- Public and Regulatory Integration: Integrate new technology acceptance activities with stakeholders, regulators and tribal entities including the WGA, to gain public acceptance of new technologies 4,500

Total, FY 1997 Mixed Waste, Characterization, Treatment, and Disposal $56,290

Explanation of Funding Changes FY 1996 to FY 1997

- The increase from FY 1996 is for initiation of waste form performance evaluations and development of technologies to address ancillary deficiencies identified in the Site Treatment Plan in order to provide complete treatment systems.

Major Issues

- None

RADIOACTIVE TANK WASTE REMEDIATION

I. Mission Supporting Goals and Objectives

There are over 332 storage tanks across the DOE complex containing over 100 million gallons of radioactive waste with most having significantly exceeded their life span and presenting occupational/public exposure risks. Current site baseline technologies are costly, pose significant programmatic and safety risks, and have technology gaps. The 1995 Baseline Environmental Management Report (BEMR) life-cycle cost estimate for high-level waste management was $50 billion. Current annual operating costs for high-level waste management represent 18 percent of EM's total budget. The mission of this Focus Area is to manage an integrated technology development program that results in the application of technology to safely and efficiently accomplish tank waste remediation across the DOE complex. Execution of this mission will enable tank farm closure while minimizing life-cycle cost.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Radioactive Tank Waste Remediation	$23,094	$30,452	$37,073	$6,621	22%

III. Performance Summary

FY 1995 Accomplishments

- Demonstrated (pilot-scale) Raman spectrometry hot-cell screening system and moisture sensor for analysis of ferrocyanide and moisture content of tank waste. These characterization tools address Hanford tank safety concerns.
- Developed Light Duty Utility Arm system ordered by users at the Idaho National Engineering Laboratory, Hanford, and the Oak Ridge National Laboratory, for tank characterization and waste retrieval.
- Demonstrated (pilot-scale) high pressure water-jet technology for tank waste retrieval.
- Removed cesium (pilot-scale) from Oak Ridge alkaline tank waste using sorbents developed by the Tank Focus Area and the Efficient Separations and Processing Crosscutting Program in preparation for a large-scale (processing 25,000 gallons) demonstration starting in FY 1996.
- Prepared mobile evaporator for hot demonstration on Melton Valley Storage Tanks (MVST) waste at Oak Ridge in FY 1996.

FY 1996 Accomplishments (To Date and Planned) - Radioactive Tank Waste Remediation (cont'd)

- Complete demonstration of 2 hot-cell based core scanning technologies for elemental and moisture analysis. Deploy at Hanford, the moisture analysis technology to reduce cost and time of safety related characterization needs.
- Prepare in situ chemical speciation sensor package on cone penetrometer for deployment in Hanford tanks.
- Deliver and commence testing of Light Duty Utility Arm Systems for deployment in tanks at Hanford, Oak Ridge, and Idaho for characterization and waste retrieval.
- Complete (full-scale) development of high-pressure water-jet waste retrieval and conveyance systems for Oak Ridge and Idaho tanks.
- Initiate mobilization of salt cake from Tank 41 at Savannah River as part of Waste Retrieval and Tank Closure Demonstration of alternative retrieval technology.
- Transfer out-of-tank evaporator technology to Oak Ridge to reduce waste volume and reduce need for additional tank construction.
- Initiate (full-scale) hot demonstration of cesium removal on 25,000 gallons of Melton Valley Storage Tank Waste at Oak Ridge.
- Demonstrate and transfer technology for TRU removal from acid wastes to Idaho.
- Transfer Extended Sludge Processing technology to Hanford for cesium and technetium removal from supernates.
- Complete process development for vitrification of cesium-loaded sorbent generated by Oak Ridge waste treatment.
- Initiate implementation of LLW immobilization for Oak Ridge gunite tank waste materials.

FY 1997 Planned Accomplishments

Characterization/Safety $9,158

- Transfer hot cell scanning technology for elemental analysis of core samples to Hanford user. Reduces characterization cost time.
- Transfer in situ probe for detection of molecular species in tank waste to Hanford user. Reduces need for core based analyses.
- Transfer Light Duty Utility Arm system for characterization, inspection, and retrieval application at three tank sites.
- Initiate development of process monitoring and control systems for retrieval and pretreatment processing and for safe storage of wastes.

Retrieval/Closure 8,225

- Complete testing and deploy high-pressure water-jet system in Oak Ridge gunite and Idaho tanks to retrieve waste heels.
- Support the closure of Savannah River Site (SRS) tanks using heel removal technology and appropriate closure criteria.

2450

III. Performance Summary - Radioactive Tank Waste Remediation (cont'd)

FY 1997 Planned Accomplishments

Pretreatment 8,482
- Complete transfer of cesium removal technology to Oak Ridge for treatment of Oak Ridge Melton Valley Storage Tanks waste.
- Complete transfer of solid-liquid separations to Oak Ridge as part of a gunite tank remediation system.
- Implement and transfer strontium (Sr) removal technology from acid wastes to Idaho for volume reduction.
- Develop and demonstrate caustic recycle technology on Savannah River tank wastes.
- Provide performance data on enhanced sludge washing to Hanford to impact development of process design to minimize volume of HLW for disposal.
- Initiate implementation of counter current decanting technology on SRS sludges.

Immobilization 4,208
- Vitrify cesium-loaded sorbents resulting from cesium removal demonstration to demonstrate complete cesium treatment system through final waste form.
- Using grout and glass processes, immobilize retrieved gunite tank wastes to select LLW waste form based on actual performance data.

Hanford Tank Initiative ..... $ 7,000
- Identify commercially available technologies to be used in Hanford Single Shell Tank heel removal and closure.
- Characterize residual wastes in a target tank in preparation for tank closure (Tank 104-AX is proposed).
- Initiate removal of waste from tanks to support process development design.
- Obtain cost-performance data for tank retrieval to facilitate closure decisions at Hanford.

Total, FY 1997 Radioactive Tank Waste Remediation $37,073

Explanation of Funding Changes FY 1996 to FY 1997

- The increase from FY 1996 reflects an initiative to demonstrate characterization and retrieval technologies in Hanford tanks resulting in 2 tank closures in four years and supports Phase II privatization activities.

Major Issues

- None

CONTAMINANT PLUME CONTAINMENT

I. Mission Supporting Goals and Objectives

Eighty-five percent of the EM Office of Environmental Restoration's high priority problems are contaminated plumes-related, amounting to more than 600 billion gallons of contaminated groundwater and more than 200 million cubic yards of contaminated soils. Two-thirds of the plumes contain mixed radioactive and hazardous contaminants and most organic contaminant plumes are suspected of containing dense non-aqueous phase liquid sources (DNAPLS) e.g., chlorinated-solvents, which are heavier than water. The mission of this Focus Area is to provide new cleanup approaches that reduce the cost of groundwater and soil remediation, while reducing risk consistent with future land use and DOE cleanup needs schedules.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Contaminant Plume Containment	$32,674	$30,742	$31,017	$275	1%

III. Performance Summary

FY 1995 Accomplishments

- Improved technologies resulting in improved barrier materials and installation methods (Polysiloxane Viscous Liquid Barrier) for permeable barrier construction.
- Developed subsurface access cryogenic drilling method and a method for Potassium Permanganate Injection into the subsurface using a Multi Point Injection System for treating chlorinated solvents trapped in low-permeability media.
- Made four technologies available for transfer, including a characterization (Unsaturated Flow Apparatus), a subsurface access (Resonant Sonic TM drilling), container (Enviro Wall Containment System) and treatment technologies (Thermally Enhanced Vapor Extraction System).
- Thirty percent of the Plume Focus Area budget was directed to the private sector (outside of Industry Programs) for technology development to further enhance commercial availability of technologies for site implementation.

FY 1996 Accomplishments (To Date and Planned)

- Transfer 2 improved technologies for chlorinated solvent remediation by Electro-Osmosis (LASAGNA™) and In Well Vapor Stripping.
- Conduct full-scale demonstrations of permeable barriers including reactive barriers using iron or sorption media emplaced in subsurface treatment zones or created through the injection of chemical reducing agents including chemically enhanced barriers at the Hanford site.

III. Performance Summary - Contaminant Plume Containment (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- Conduct full-scale demonstrations of in situ transformation technologies including chemical oxidation/reduction methods to reduce risk from contaminants such as radionuclides and organics including: In Situ Chemical treatment/Gaseous reduction of Chromium at a DOD site, In Situ Chemical Oxidation of Contaminated Soils at the Kansas City Plant, and In Situ Redox Manipulation at the Hanford site.
- Conduct pilot- and full-scale demonstrations to address engineering issues for groundwater reinjection as an environmental solution-mining technology, environmental measurement of radiation during drilling, and the cost avoidance of smart sampling methods including Enhanced Recovery of Uranium/In Situ Mining and Environmental Measurement While Drilling.
- Conduct pilot- and full-scale demonstrations of ex situ separation technologies including magnetic separation, chemical separation, and biological separations for metals and radionuclides including: MAG*SEP™ for groundwater remediation, Mound Selentec Feasibility Study for treating plutonium in soils, three Resource Recovery Project technology demonstrations, and a Biomass Remediation System for treating dispersed surfacial contamination.

FY 1997 Planned Accomplishments

Reactive and Deep Subsurface Barriers	$ 6,220
• Conduct pilot- and full-scale tests of reactive barriers to selectively contain metals, and deep barriers to prevent further migration of plumes or to focus groundwater flow (including use of adsorptive materials and hydraulic guides).	
Metals and Radionuclides in Aquifer Media	8,141
• Conduct pilot- and full-scale tests of systems to characterize and remove or immobilize metals in aquifers using oxidation/reduction, bioremediation, and solution mining (including a portable tritium analysis system, polymeric separations, MAG*SEP (TM) and related solution mining technologies, electromigration systems, chemical oxidation/reduction manipulation, and bioaccumulation).	
DNAPLs in Aquifer Media	6,498
• Conduct pilot-scale demonstration of systems for characterization and remediation of Dense Non-Aqueous Phase Liquids (DNAPL) trapped in saturated and unsaturated media (including tracer systems, geophysical and chemical tools for determining the contaminant distribution, mobilization systems for remediating DNAPL pools, and down-hole treatment modules).	
DNAPLs in Soils	10,158
• Conduct full-scale testing of characterization techniques and chemical flooding of biological systems for the removal or destruction of DNAPL sources trapped in the soil in and above anaquifer, including soil heating thermal technology, recirculation well treatment of Tecnesium and chlorinated solvents, intrinsic anaerobic bioremediation, and a modified in-well vapor stripping system.	
Total, FY 1997 Contaminant Plume Containment	$31,017

III. Performance Summary - Contaminant Plume Containment (cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

- None

Major Issues

- None

LANDFILL STABILIZATION

I. Mission Supporting Goals and Objectives

DOE landfills contain an estimated 3 million cubic meters of buried waste with most transuranic, low-level and/or hazardous waste posing threats to the environment and the public. The mission of this Focus Area, is using the best available science and technology, to develop, demonstrate, and implement containment/remediation/disposal technology systems that enable effective remediation/treatment, reduce risks, and reduce costs consistent with future land use and DOE cleanup needs schedules.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Landfill Stabilization	$31,048	$27,066	$26,818	$-248	1%

III. Performance Summary

FY 1995 Accomplishments

- Demonstrated technology systems to achieve the goal of source term containment by January 1997 including a full scale cold demonstration of the close-coupled barrier at Hanford, bench scale demonstration of in situ waste destruction and vitrification system and a pilot scale demonstration of alternative landfill covers for the arid and semi-arid western United States in conjunction with EPA and state regulators.
- Demonstrated technology systems to meet goal of retrieval of source terms including the Cooperative Telerobotic Retrieval System and the Cryogenic Cutting System at the INEL Cold Test Site.
- Demonstrated technology systems to meet goal of treatment and processing of excavated wastes including bench scale test of High Gradient Magnetic Separation Monitor for soil cleanup at Fernald, bench scale demonstration of the Minimum Additive Waste Stabilization to produce glass and vitreous ceramic wasteforms, and a pilot-scale demonstration of the graphite DC arc Plasma System with simulated buried waste.
- Demonstrated technology systems for non-destructively verifying and monitoring transuranic containerized waste, implemented the Dig-face Characterization System at Mound Area 7, and implemented the Multi Sensor Analysis Program with the EM Office of Environmental Restoration at the Sandia Chem Waste Landfill.

III. Performance Summary - Landfill Stabilization (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- Demonstrate technology systems to meet goal of containment of source items including 4 pilot scale alternative landfill cover systems, in a Smart Geomembrane to monitor performance throughout the life of the landfill, and a close-coupled barrier system at a Brookhaven Glass Bottle Pit with EM-40. All systems include verification and monitoring tools to test the integrity and long-term performance of the systems.
- Demonstrate technology systems for removal, treatment, processing, and disposal of buried waste including a pilot demonstration of ex-situ removal/treatment of TRU/LLW using Arc Plasma technology, a bench scale demonstration of hybrid plasma technology to treat waste containing Pu-238 and a full demonstration at a cold site of In Situ Waste Destruction and Vitrification.
- Demonstrate technology systems for the in situ stabilization of buried waste including a multi-port jet grouting process to stabilize buried waste prior to retrieval at the INEL Cold Test Site and 4 different emplacement methods of different grout materials at an Oak Ridge Cold Test Site with the EM Office of Environmental Restoration.
- Demonstrate the ability to safely retrieve radioactive waste by implementation of the Dig-Face Characterization system at the Sandia radioactive landfill.

FY 1997 Planned Accomplishments

• Demonstrate and/or implement technology systems to address the containment of source terms including a viscous liquid vertical and horizontal barrier at Savannah River H-basin, Cryocell™ at Oak Ridge, polymer based grout barrier at Hanford, European gouting techniques for vertical and horizontal barriers, and several different innovative landfill covers for the arid west at the Sandia pilot-scale test field. All systems include verification and monitoring as well as the development of performance specifications for use at other sites	$18,493
• Demonstrate the ability to safely retrieve waste by the implementation of the Cooperative Telerobotic Retrieval System at INEL Pit 9 in conjunction with tools developed by the EM Office of Environmental Restoration	4,402
• In conjunction with stabilization of TRU-buried waste, demonstrate Active Passive Neutron Examination, and Assay characterization system at INEL Cold Test Site	3,487
• Demonstrate the ability to safely treat waste in situ at Oak Ridge using the bottom-up In Situ Vitrification System	436
Total, FY 1997 Landfill Stabilization	$26,818

DECONTAMINATION AND DECOMMISSIONING

I. Mission Supporting Goals and Objectives

Over 7,000 contaminated buildings in the complex need deactivation with 700 requiring decommissioning. These buildings currently account for an inventory of over 600,000 metric tons of metals and 6.3 million cubic feet of contaminated concrete plus an estimated 400,000 metric tons of metal in scrap piles. Inefficiencies in baseline technologies pose high safety and health risks for workers along with high surveillance and maintenance costs in the disposition of this inventory. The mission of this Focus Area is to develop and demonstrate improved technologies and systems to solve customer-identified needs to decontaminate and decommission DOE's radiological contaminated surplus facilities and their contents and to facilitate the acceptance, approval, transfer, commercialization and deployment of these technologies and systems.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Decontamination and Decommissioning	$12,874	$14,694	$15,675	$981	7%

III. Performance Summary

FY 1995 Accomplishments

- Successfully tested/demonstrated full scale process to fabricate stainless steel containers from materials with residual contamination.
- Successfully tested engineering development/pilot scale microwave concrete decontamination system.
- Successfully tested engineering development/pilot scale Rothotherm evaporator process on plutonium surrogate solutions.
- Successfully tested advanced development/bench scale nozzle, which is part of a process to decontaminate a metal surface using carbon dioxide pellets with a liquid nitrogen carrier.

FY 1996 Accomplishments (To Date and Planned)

- Conduct three large-scale demonstration projects.
- Demonstrate full scale metal and concrete dismantlement system at the Chicago Pile 5 Reactor Decommissioning Project.
- Demonstrate full scale equipment decontamination methods, material handling, and size reduction equipment, and improved worker protection systems at the Fernald Plant 1 decommissioning project.
- Demonstrate full scale process to characterize facilities around the Hanford C-Reactor to cocoon the graphite reactor block.
- Demonstrate full scale process to decontaminate interior metal surfaces using a gas phase technology at the Portsmouth Gaseous Diffusion Plant.

III. Performance Summary - Decontamination and Decommissioning (cont'd)

FY 1996 Accomplishments (To Date and Planned) - (cont'd)

- Demonstrate full scale asbestos immobilization chemical process at the Brookhaven National Laboratory.
- Demonstrate full scale remote laser cutting system at Hanford B-Hot Cell.
- Demonstrate full scale process for final disposition of asbestos at Hanford.
- Demonstrate full scale process to decontaminate a Plutonium Contaminated Glovebox at Savannah River.
- Demonstrate full scale process to decontaminate tru-contaminated material and minimize Transuranic Waste in a Battelle Columbus Hot Cell.

FY 1997 Planned Accomplishments

Large-Scale Demonstration (LSD)	$ 9,900
• Demonstrate a suite of full-scale deactivation, decontamination, dismantlement, and materials disposition technologies for the deactivation and decommissioning of on-going D&D projects.	
• Continue the dismantlement of the Chicago Pile 5 Test Reactor, the Fernald Plant 1 Uranium Processing Facility, and deactivation/cocooning of C-Reactor/graphite reactor block.	
• Initiate the fourth (4th) and fifth (5th) LSDs for plutonium, uranium, tritium, and lithium processing facilities or gaseous diffusion plant.	
• Obtain technology cost and performance data for improved and baseline technologies to facilitate commercial deployment.	
Industry Solicitation	3,060
• Demonstrate private sector technologies (full scale for the first time within the DOE complex) in the Large Scale Demonstrations.	
• Decontaminate Concrete/Metal building materials while minimizing secondary waste.	
• Remotely dismantle structures and recycle building materials.	
Technology Insertion Projects	2,715
• Demonstrate innovative solutions at full scale within existing D&D projects to address gaps and urgent needs for which a LSD is not available.	
• Deactivate, decontaminate, and decommission a fuel storage pool.	
• Decontaminate and dismantle glovebox and hot cells.	
Total, FY 1997 Decontamination and Decommissioning	$15,675

III. Performance Summary - Decontamination and Decommissioning (cont'd)

Explanation of Funding Changes FY 1996 TO FY 1997

- The increase from FY 1996, reflects the recently adopted strategy of introducing innovative technologies and systems to the customer via Large Scale Facility Demonstrations at selected DOE sites. The use of large scale demonstrations as the major mechanism to conduct D&D technology development activities represent a major shift in the management and provides opportunities to achieve or accelerate the completion of EM's D&D programmatic objectives while demonstrating a suite of innovative/improved technologies.

Major Issues

- None

CROSSCUTTING PROGRAMS

CHARACTERIZATION, MONITORING, AND SENSORS

I. Mission Supporting Goals and Objectives

Before remediation, treatment, and D&D activities can commence, 3,700 contaminated sites, 1.5 million barrels of stored waste, 385,000 m^3 of high-level tank waste, and between 1,700 and 7,000 facilities require characterization. In addition, characterization and sensor technologies are needed that enhance the safe and effective monitoring of waste retrieval, site remediation and closure, waste treatment, and D&D processes. This Crosscutting program's mission is to address high priority needs identified by the five Focus Areas through promoting the development and application of advanced characterization technologies and strategies through focused research and development.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Characterization, Monitoring, and Sensors	$19,505	$14,602	$15,553	$951	7%

III. Performance Summary

FY 1995 Accomplishments

- Implemented expedited site characterization methodology at the DOE Pantex facility realizing a $4M savings.
- Demonstrated instrumentation for cone penetrometers to sample groundwater, determine sampling location, and monitor vadose zone moisture eliminating need to drill monitoring wells for sample collection..
- Demonstrated real-time portable analyzers for monitoring volatile organic compounds in wells at Idaho and Savannah River.
- Demonstrated electrical resistance tomography for detection of leaks as small as 50 gallons from buried high-level waste tanks.
- Demonstrated the Fourier Transform Infrared spectrometric system for continuous emission monitoring at incinerator sites at Oak Ridge and Jefferson, Arkansas, with the goal of obtaining Environmental Protection Agency Best Demonstrated Available Technology designation.

III. Performance Summary - Characterization, Monitoring, and Sensors

FY 1996 Accomplishments (To Date and Planned)

- Assess the performance of process monitors and controls for assurance of waste form quality in plasma and vitrification treatment systems.
- Employ monitors for closed-loop/controlled-release off-gas systems in initial, permitting, and complete testing of plasma and vitrification treatment systems.
- Develop sensors and deployment systems for in situ measurement of physical and chemical properties of tank waste.
- Integrate the expedited site characterization methodology into working plan for environmental restoration activities at DOE's Savannah River Site.
- Demonstrate techniques for locating uranium, plutonium, or RCRA metals on surfaces and inside sealed pipes and ducts at Oak Ridge.
- Complete development of field deployable instrumentation for chemical analyses and groundwater samples.

FY 1997 Planned Accomplishments

Waste Characterization I ..... $ 4,355

- For plasma and vitrification treatment: develop, validate, and implement automated, non-intrusive and non-destructive screening/characterization systems for incoming waste in unopened containers. Initial systems will be transportable to support compact mobile treatment systems.
- High-level waste tank sensor systems for in situ: test of physical properties of tank waste; geophysical methods for detecting gross matrix characteristics; and chemical analysis methods.
- High-level waste tank sensor deployment systems (e.g., cone penetrometer sensor systems, or novel remote sensing fiber optics): to deploy sensors for analyzing tank waste.

Site Characterization 2,800

- Complete development of non-intrusive geophysical methods to characterize and locate buried waste, buried structures, waste zones, and geologic structures.

Process Monitoring and Control 4,250

- For thermal treatment processes: develop, validate, and implement continuous on-line process monitors and controls for closed-loop cleanup and controlled release off-gas systems.
- Develop, validate, and implement process monitoring sensors for support of process control for product quality assurance.
- Develop, validate, and implement process monitoring sensors and systems for monitoring and documenting final waste form quality.
- Develop, validate, and implement continuous real time monitors for radionuclides in liquid process and effluent of mixed waste treatment systems.

III. Performance Summary - Characterization, Monitoring, and Sensors

FY 1997 Planned Accomplishments (cont'd)

Contaminant Containment, and Stabilization Characterization	1,448
• On-line monitoring of chemical (metals and organics) and radioactive contaminants during cleanup and treatment of soils and groundwater.	
• Monitoring technology for the emplacement and effectiveness of subsurface barriers.	
• Sensors and Instrumentation for subsurface deployment by cone penetrometer or other minimally intrusive methods for determination of metal and radioactive contaminants.	
Facility Characterization	2,700
• Instrumentation for non-destructive assay of RCRA metals and radionuclides in process equipment, ducts, and pipes.	
Total, FY 1997 Characterization, Monitoring, and Sensors	$ 15,553

Explanation of Funding Changes FY 1996 to FY 1997

- Increase over FY 1996 provides emphasis on incorporating newly developed sensors for process controls and emission monitors into the plasma and vitrification waste treatment systems and tank characterization activities.

Major Issues

- None

EFFICIENT SEPARATIONS and PROCESSING

I. Mission Supporting Goals and Objectives

Separations and selected treatment processes are needed to treat and immobilize a broad range of radioactive wastes. Treatment technologies do not exist in some cases, while in others, improvements are needed to reduce costs, reduce secondary waste volumes, and to improve waste form quality. The mission of this Crosscutting program is to develop improved, safe, cost-effective separations and treatment processes which are to be integrated into systems developed by the focus areas.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Efficient Separations and Processing . .	$14,716	$12,685	$12,747	$62	0%

III. Performance Summary

FY 1995 Accomplishments

- Demonstrated plutonium residue treatment (supports Defense Nuclear Facility Safety Board 94-1) on bench-scale.
- Achieved industrial scale production of new crystalline silicontitanate (CST) sorbent that will result in improved cesium removal capabilities from waste waters.
- Demonstrated 3M™ web technology to address the removal of technetium from aqueous streams at West Valley.
- Demonstrated feasibility of separation of tritium from water.
- Demonstrated industrially, the Chelating Polymer Technology for metal removal from water to meet regulatory standards, and won a R&D 100 award.

FY 1996 Accomplishments (To Date and Planned)

- Plutonium residue treatment offering savings in the $100 million to $300 million range to be transferred to the EM Office of Nuclear Material and Facility Stabilization for demonstration at Rocky Flats.
- CST sorbent demonstrated and selected for cesium removal from alkaline tank wastes at Oak Ridge.
- Provide sorbents for reactive barriers used in plume mitigation.
- Chelating Polymer Technology demonstration planned for removal of Pu and Am from plutonium facility waste waters. Potential $40M savings identified, and commercialization actively pursued.

23-254 96-78

2463

III. Performance Summary - Efficient Separations and Processing (cont'd)

FY 1997 Planned Accomplishments

Long-Lived Radionuclide Separations • Initiate development of transuranic separations from soils, solid matrices, and deactivation wastes such as plutonium residues. • Demonstrate technology to remove technetium from groundwater. • Complete development of acid waste transuranic removal; provide transuranic separations for decontamination wastes. • Initiate work on removal of uranium from soils, soil wash wastes, and decontamination wastes.	$ 3,447
Short-Lived Radionuclide Separations • Develop and transfer cesium and strontium sorbents for reactive barriers. • Demonstrate separation of tritiated water from groundwater, pond water, spent fuel storage pool water, or mixed waste steams. • Demonstrate separations for cesium and strontium from acid tank waste and basic tank wastes.	3,800
Heavy and Toxic Metal Separations • Develop separations technologies for mercury from soils, mixed waste, and solid matrices. • Develop separations for lead, cadmium, chromium, and/or cobalt from aqueous waste streams.	2,300
Waste Treatment and Processing • Develop separations technologies in support of remediation of DNAPLs (Plumes). • Develop and demonstrate sodium management.	3,200
Total, FY 1997 Efficient Separations and Processing	$12,747

Explanation of Funding Changes FY 1996 to FY 1997

- None

Major Issues

- None

2464

ROBOTICS

I. Mission Supporting Goals and Objectives

Robotic technologies reduce worker exposure to the absolute minimum while providing proven cost-effective (and in some cases the only acceptable) approach to cleanup. The mission of this Crosscutting program is to develop robotic systems where justified by safety, cost, and/or efficiency arguments.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Robotics	$22,279	$14,921	$15,883	$962	6%

III. Performance Summary

FY 1995 Accomplishments

- Demonstrated advanced multi-plane oscillation damping controls, surface following, and collision avoidance on manipulator arm systems.
- Completed validation and demonstration of integrated standard analysis method for automated analysis of soils and sludges contaminated with organics.
- Selected private systems integrator and commercializer for chemical analysis automation systems.
- Demonstrated autonomous robot for inspecting stored waste drums.

FY 1996 Accomplishments (To Date and Planned)

- Complete automated analytical chemistry module subsystems for RCRA metals contaminants and integrate into a metals analysis systems for samples in solid and liquid matrices; start beta testing of the non-volatile organics system.
- Complete and integrate all Robotics Technology Assessment Facility subsystems and conduct comprehensive cold demonstration using realistic mockup of an actual decontamination and dismantlement project, the CP-5 Reactors at Argonne National Laboratory.
- Integrate generic controls, cost/benefit and simulation efforts; focus coordinated manipulator work on Decontamination and Dismantlement.
- Develop and demonstrate advanced graphics controls, simulation/modelling, and sensor integration on Oak Ridge Light Duty Utility Arm.

III. Performance Summary - Robotics (cont'd)

FY 1997 Planned Accomplishments

Mixed Waste Materials Handling	
• Design/develop front-end materials handling and remote sizing systems.	$ 4,100
Tank Waste Retrieval System	
• Integrate all systems on the Light Duty Utility Arm and a separate mobile system. Demonstrate cooperative retrieval of waste by two systems at the gunite Tank Project, Oak Ridge National Laboratory.	2,100
D&D Systems	
• Demonstrate remote systems at the CP-5 Reactor Dismantlement Project, Arngonne National Laboratory.	4,900
Contaminant Analysis Automation	
• Complete development of semi-volatile organics and metals automated analysis systems and beta site test the metals system.	4,783
Total, FY 1997 Robotics	$15,883

Explanation of Funding Changes FY 1996 to FY 1997

- The increase in FY 1997 allows the acceleration of the deployment for a mobile system to be used in cooperation with the Light Duty Utility Arm at the Oak Ridge Tank Farm.

Major Issues

- None

2466

PRIVATE INDUSTRY AND UNIVERSITY PROGRAMS

PRIVATE INDUSTRY PROGRAMS

I. Mission Supporting Goals and Objectives

The private sector is an increasingly important source of innovative technologies, which must be or are being adapted by DOE to improve the efficiency and reduce the costs of its cleanup program. While technologies from larger companies are identified and developed within this program, special attention is also given to expanding the role of the small business community. The mission of the Private Industry and University Programs is to involve the private sector and universities in developing, demonstrating, and implementing improved and commercially viable technologies that address the needs of the Focus Areas for use by DOE.

II. Funding Schedule

Program Activity	Comparable Appropriation	FY 1995 Comparable Appropriation	FY 1996 FY 1997 Request	$ Change	% Change
Private Industry Programs	$47,651	$46,900	$40,599	$-6,301	-13%

III. Performance Summary

FY 1995 Accomplishments

- Deployed the Halogenated Chemical monitor as the primary analytical method for the vapor samples required for Routine Quarterly Monitoring at Idaho and to obtain a database of passive vapor emissions within the 200W area of Hanford.
- Conducted field testing of the geophysical data fusion for subsurface imaging software package.
- Completed "cold" demonstration of a remote-controlled, mobile, dual-arm work system as a platform to perform physical tasks.
- Experiments demonstrated that the electrodes with gas injection extend the life of a plasma arc torch by a factor of 10 or more. Design and fabrication of the platelet-cooled anode was completed. Multiple electrodes have been purchased by an end-user.

FY 1996 Accomplishments (To Date and Planned)

- Test the catalytic wet oxidation process for the treatment of multicomponent wastes.
- Construct a full scale, 25 tons per day transportable vitrification system at the Paducah Gaseous Diffusion Plant in Paducah, Kentucky, for the Mixed Waste Focus Area.
- Demonstrate the advanced design of prototype advanced worker protection system, which features a self-contained, extended service time breathing and cooling system for the Decontamination and Decommissioning Focus Area.

III. Performance Summary - Private Industry Programs (cont'd)

FY 1996 Accomplishments (To Date and Planned) (cont'd)

- Conduct integrated process testing for an electromagnetic mixed waste processing system for decontamination of asbestos insulation in various forms.
- Demonstrate on site, real-time, controllable electro-hydraulic scabbling process to remove thin layers of surface contamination from concrete.
- Initiate project for development of improved methods for efficient separations processes for highly radioactive and "high-risk" mixed wastes.

FY 1997 Planned Accomplishments

Mixed Waste	$12,693
• Initiate development of ancillary technologies supporting DOE improved treatment of mixed waste such as off-gas treatment.	
• Begin projects for non-thermal treatment options and advancements to current thermal treatment options.	
Radioactive Tank Waste	1,385
• Demonstrate technologies for improved tank waste characterization, retrieval, pretreatment, and immobilization.	
Landfill Stabilization	300
• Complete technology development for landfill characterization and surface and subsurface containment.	
• Demonstration of improved technologies stabilization, removal, and treatment of buried waste and contaminated soils.	
Contaminant Plume Containment	8,075
• Initiate technology development projects for in situ treatment, containment/stabilization and assessment of heavy metals and radionuclides in soils and groundwater.	
• Demonstration of improved methods characterization, assessment, containment, and remediation of dense non-aqueous phase liquids.	
• Development of sensors, detectors, and sampling techniques, which provide improved means of characterizing the content, extent, stability, and the movement of waste material.	
Decontamination and Decommissioning	8,574
• Demonstrate commercially viable processes for decontamination of concrete and metal surfaces while generating less secondary waste.	
• Development of projects for demonstration of reuse of bulk contaminated materials within DOE.	
• Demonstration of robotics and automation systems to reduce human exposure and enable timely completion of remediation activities.	

TECHNOLOGY DEVELOPMENT - PRIVATE INDUSTRY AND UNIVERSITY PROGRAMS (cont'd)

III. Performance Summary - Private Industry Programs (cont'd)

FY 1997 Planned Accomplishments

Technology Base Development	7,403
• Conduct technology based research and development and other technical studies in support of industrial projects.	
New Projects	2,169
• Initiate new projects to meet identified focus area needs.	
Total, FY 1997 Private Industry Programs	$40,599

Explanation of Funding Changes FY 1996 to FY 1997

- The FY 1997 Focus Areas' needs for private industry technology development are increasingly reflected in the Focus Area budgets. Minimal new activities are expected in FY 1997 without support from each of the Focus Areas and Crosscutting Programs.

Major Issues

- None

2469

UNIVERSITY PROGRAMS

I. Mission Supporting Goals and Objectives

Universities provide a unique opportunity to cooperate with the academic community in the development of fundamental data related to the application of technology development and the follow-up activities related to the resolution of technical issues and system optimization. Attention is given to providing credible data, from non-conflicted, recognized experts in support of activities related to the acceptance of innovative technologies by the regulators and stakeholders.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
University Programs	$12,165	$10,100	$17,813	$7,713	+76%

III. Performance Summary

FY 1995 Accomplishments

- Established a program for the Investigation of Hazardous Materials in Aquatic Environments.
- Sponsored a conference in Eastern Europe on Hazardous Waste Remediation Technology Development to facilitate the evaluation and transfer of European Technologies into the DOE complex.
- Deployed mobile laboratory with diagnostic instrumentation for monitoring Plasma and Vitrification Systems.
- Established a sensor program in support of activities in the Decontamination and Decommissioning and Radioactive Tank Waste Remediaiton Focus Areas.

III. Performance Summary - University Programs (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- Established a partnership with a Polish University to facilitate the evaluation and transfer of European environmental technologies for application to DOE problems.
- Continue the sensor program in support of activities in the Decontamination and Decommissioning and Radioactive Tank Waste Remediation.
- Conducted, for the Contaminant Plume Focus Area, evaluations of the health of contaminated aquatic environments in the Mississippi River Basin in support of the concept that through natural processes, "Intrinsic Remediation" or self cleaning of the environment does occur.
- Continue development and demonstration of advanced diagnostic methods to characterize the plasma properties, melt properties, and downstream emissions from plasma torch facilities for the treatment of mixed waste.
- Initiated a series of technology demonstrations applicable to the Mixed Waste, Radioactive Tank Waste Remediation, and Decontamination and Decommissioning Focus Areas. Emphasis will be placed on integrating Western European research and development activities into the Focus Areas.

FY 1997 Planned Accomplishments

• Joint demonstration of characterization and remediation technologies with European partners	$1,500
• Continue the sensor program to support activities in the Decontamination and Decommissioning and Radioactive Tank Waste Remediaiton Focus Areas	5,000
• Continue evaluation of the capability of aquatic environments to attenuate contamination processes through natural biological and chemical activities	5,000
• Demonstrate advanced diagnostic and control instrumentation on operating plasma systems developed for mixed waste treatment	4,313
• Continue demonstrations of applicable western European technologies in the Radioactive Tank Waste Remediation and Decontamination and Decommissioning Focus Areas to demonstrate potentially significant cost savings, increased productivity, reduced environmental impacts, and improved worker health and safety	2,000
Total, University Programs	$17,813

Explanation of Funding Changes FY 1996 to FY 1997

- FY 1997 funding reflects increase in activities related to the Radioactive Tank Waste Remediation and Decontamination and Decommissioning Focus Areas.

Major Issues

- None

2471

FEDERAL ADVISORY COMMITTEE/DEVELOP ON-SITE INNOVATIVE TECHNOLOGIES:

I. Mission Supporting Goals and Objectives

This activity supports the development of stakeholder activities and regulatory cooperation with the Western Governors' Association (WGA) to facilitate the implementation of new technologies nationwide.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Federal Advisory Committee/Develop On-site Innovative Technologies	$1,320	$0	$0	$0	0%

III. Performance Summary

FY 1995 Accomplishments

- Established a Memorandum of Agreement among the States of California, Illinois, Massachusetts, and New Jersey committing the states to accept data on the performance of technologies demonstrated in other member States and adopt institutional incentives to promote the commercialization of innovative cleanup technologies.
- Established a twenty-one State Interstate Technology and regulatory Cooperation Working Group to facilitate cooperation among states in a common effort to test, demonstrate, evaluate, verify, and deploy innovative environmental technologies.

FY 1996 Accomplishments (To Date and Planned

- Federal Advisory Committee charter will expire June 1996; the Western Governors' Association Develop On-site Innovative Technologies will continue to function as a States organization without Federal sponsorship.
- Four more States; New York, Pennsylvania, Texas, and Washington have indicated that they will join the MOU. Member States committed to accepting data on the performance of technologies demonstrated in other member States and adopt institutional incentives to promote the commercialization of innovative cleanup technologies.

III. Performance Summary - Federal Advisory Committee/Develop On-site Innovative Technologies (cont'd)

FY 1997 Planned Accomplishments

- Federal Advisory Committee charter expired June 1996; the Western Governors' Association Develop On-site Innovative Technologies will continue to function as a States organization without Federal sponsorship.

Total, FY 1997 Federal Advisory Committee/Develop On-site Innovative Technologies ..... $ 0

Explanation of Funding Changes FY 1996 to FY 1997

SMALL BUSINESS INNOVATIVE RESEARCH PROGRAM

I. Mission Supporting Goals and Objectives

Grants provided via the Small Business Innovative Research (SBIR) Program advance technologies in the areas of chemical separations, characterization and in situ soil and groundwater treatment, which have direct application to the EM program.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Small Business Innovative Research Program	$0 1/	$4,337	$3,742	$ -595	-14%

III. Performance Summary

FY 1995 Accomplishments

- In FY 1995 EM was awarded 11 Phase I and 2 Phase II projects.

FY 1996 Accomplishments (To Date and Planned)

- FY 1996 projects are still being evaluated.

FY 1997 Planned Accomplishments:

- FY 1997 projects to be determined.

Explanation of Funding Changes FY 1996 to FY 1997

-

Major Issues

-

1/ Funding transferred to DOE's Office of Energy Research for administration of SBIR funding and grants.

TECHNOLOGY INTEGRATION

DOMESTIC TECHNOLOGY INTEGRATION

I. Mission Supporting Goals and Objectives

The mission of the Domestic Technology Integration Program is to assist the Focus Areas to maximize the commercial availability, acceptability, and implementation of new environmental technologies that are needed for environmental management at DOE sites. Full and early involvement by all interested parties is critical to the success of the technology development program. The program accomplishes this mission by: (1) providing the mechanisms, standardized methodologies, and initiatives to conduct the Focus Area programs and establish priorities with detailed input on considerations of other stakeholders, technology developers, DOE site cleanup operations, regulators, and the business sector; and (2) providing information and analyses for continual internal improvement and satisfaction of external parties decision making needs.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Domestic Technology Integration	$8,459	$17,027	$18,454	$+1,427	+8%

III. Performance Summary

FY 1995 Accomplishments

- Developed and implemented, in the Contaminant Plume Containment Focus Area, a technology deployment model that ensures orderly integration of DOE user needs, private-sector participation requirements, and regulatory and public acceptance criteria with Focus Area investment decision strategies.
- Initiated a national leveraging program to facilitate interactions between the public- and private-sectors, stimulate cost-shared development and demonstration efforts, and accelerate the commercialization of Focus Area technologies.
- Developed a successful Stakeholder Participation Strategy for EM technologies.

III. Performance Summary - Domestic Technology Integration (cont'd)

FY 1996 Accomplishments (To Date and Planned)

Systems Integration

- Implement a process for the simultaneous consideration of technical, programmatic, and non-technical factors such as commercialization, cost/benefit, public and regulator acceptance in technology development decisions.
- Institute a coordinated process involving Focus Areas and DOE site operations for setting the priority of R&D investments.
- Maintain Web-site applications for Focus Areas and other Technology Development program areas.

External Collaboration

- Develop and expedite processes for transferring stakeholders perspectives to the Focus Areas.
- Provide assistance to all Focus Areas, Crosscutting Programs, and Industry Programs to facilitate the commercialization of technologies.
- Continue multi-state demonstration and regulatory cooperation processes.
- Expand the system for multi-state verification of technology performance and cost.

FY 1997 Planned Accomplishments

Systems Integration	$ 8,625
• Apply advanced analytical methods (e.g., technology portfolio analysis, and risk analysis) in the formulation of Focus Area investment decisions. Maintain and coordinate data collection and management operations, which support the internal and external communication requirements of the Focus Areas.	
External Collaboration	9,829
• Engage stakeholders (e.g., end-users, regulators, the business community, affected tribes, and the public among others) in Focus Area decisions related to technology development investments. Assist the Focus Areas in activities with end-user sites to develop and validate performance-based treatment and remediation procurement specifications that will be accepted by stakeholders and provide commercialization facilitation services to the Focus Areas. Facilitate development of systems for multi-state cooperation, including verification of technology performance data with direct application to Focus Area technology implementation efforts.	
Total, FY 1997 Domestic Technology Integration	$18,454

III. Performance Summary - Domestic Technology Integration (cont'd)

Explanation of Funding Changes FY 1996 to FY 1997

- Implementation of WGA Federal Advisory Committee (FAC) recommendations for removal of regulatory and commercialization barriers through Interstate Technology Regulatory Cooperation Initiatives.
- Implementation of full data/information capabilities from the Technology Development information inventory.
- Program will increase its level of effort focused on the problems inherent in implementing EM-developed technologies at DOE sites.
- New emphasis on supporting performance-based cleanup and treatment procurements.

Major Issues

- None

INTERNATIONAL TECHNOLOGY INTEGRATION

I. Mission Supporting Goals and Objectives

The Office of Environmental Management (EM) is not yet realizing the full value of technical expertise, opportunities for foreign demonstrations, and cooperative technology development available through the international scientific community. The mission of the International Technology Program is to ensure continued awareness and available opportunities for EM participation with the International Science and Technology Community.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
International Technology Integration	$4,437	$3,568	$3,293	$-275	-8%

III. Performance Summary

FY 1995 Accomplishments

- Identified fifteen foreign environmental technologies for use at DOE sites, which are more efficient and effective than currently available U.S. technologies.
- Leveraged $20 million in international funding to address Focus Areas and Crosscutting Program's objectives.
- Accessed overseas test beds to allow the rapid and cost-effective demonstration of three technologies.
- Continued efforts on a significant joint U.S.-Russian research and development program for the treatment of hazardous and radioactive waste with a labor cost savings of 30:1;
- Initiated discussions and began planning with several scientific institutes in Central and Eastern Europe and Argentina to establish cooperative environmental technology development and demonstration projects;

III. Performance Summary - International Technology Integration (cont'd)

FY 1996 Accomplishments (To Date and Planned)

- Support implementation of the Expedited Site Characterization/Bioremediation demonstration project with the Polish Institute for Ecology of Industrial Areas.
- Identify foreign sites and support EM Focus Area managers in demonstrating their technologies abroad.
- Track EM involvement in the Newly Independent States Industrial Partnering Program.
- Define barriers to the import of foreign innovative technologies, and create an intellectual property rights protection plan.
- Provide interpreters/translation for international activities.
- Publish documents on EM International programs for public dissemination.
- Coordinate research assistant program, foreign delegations to international workshops.
- Manage international agreements.

FY 1997 Planned Accomplishments

International Technology Transfer	$ 475
• Develop and supply a variety of mechanisms to the Focus Areas and Crosscutting Programs in order to identify, evaluate, and acquire foreign environmental technologies that have application at EM sites; and to expedite the commercialization and transfer of EM-developed environmental technologies.	
Science and Technology Cooperation	2,818
• Participate with foreign scientific communities (Former Soviet Union/Russia, Central and Eastern European, etc.) in joint research and development activities to gain access to environmental technologies, technical information, and scientific expertise that will accelerate EM's cleanup effort.	
Total, FY 1997 International Technology Integration	$ 3,293

Explanation of Funding Changes FY 1996 to FY 1997

- Reduction reflects a decrease in the number of overseas demonstrations in FY 1997.

Major Issues

- None

PROGRAM SUPPORT

I. Mission Supporting Goals and Objectives

Program support focuses on activities that support technical, managerial, financial, and administrative functions within the various line organizations of the Technology Development program. This includes systems engineering analysis studies of various treatment and remediation options in order to determine comparative system performance, and system safety and public risk. This analysis provides the basis for selecting those systems of technologies that warrant further development or are ready for implementation. Also included is support for cost benefit analysis, organization studies, and strategic planning, coordination and interface with other federal and state agencies.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Support	$17,670	$19,635	$8,814	$-10,821	-55%

III. Performance Summary

FY 1995 Accomplishments

- Initiated field coordination groups for prioritizing technology needs in assuring technology implementation of emerging technologies.
- Initiated National Academy of Science peer review with national experts in science and engineering for determining effectiveness of technology development focus area activities.
- Completed and reported the total life cycle cost analysis of 19 thermal treatment systems options and a peer review of the results. Initiated tribal and stakeholder involvement in criteria and review process.
- Completed and reported on the overall costs of various options for use of depleted uranium for waste management; including its use as shielding for spent fuel and high-level waste.

FY 1996 Accomplishments (To Date and Planned)

- Continued National Academy of Science peer review with national experts in science and engineering for determining effectiveness of technology development focus area activities.
- Continued field coordination groups for prioritizing technology needs in assuring technology implementation of emerging technologies.
- Complete and report the total life cycle cost analysis of non-thermal treatment systems options.
- Complete a comparative analysis of thermal and non-thermal treatment systems including total life cycle costs, system performance, and safety/risk.

TECHNOLOGY DEVELOPMENT - PROGRAM SUPPORT (cont'd)

III. Performance Summary - Program Support

FY 1996 Accomplishments (To Date and Planned)

- Complete initial analysis of comparative incentives to produce various waste forms from mixed low-level waste and low-level waste.
- Implement innovative environmental technologies to be tested, with emphasis on improving worker health and safety, efficiency and productivity.

FY 1997 Planned Accomplishments

• Continued National Academy of Science peer review with national experts in science and engineering for determining effectiveness of technology development Focus Area activities	$ 1,900
• Continued field coordination groups for prioritizing technology needs in assuring technology implementation of emerging technologies	2,114
• Complete sensitivity studies to optimize and quantify potential cost savings by the application of R&D and efficiency measures	500
• Complete and report comparisons of thermal and non-thermal systems of technologies including options that will reduce costs and risks and improve overall performance and safety; complete tribal and stakeholder involvement in planning R&D, analyze subsystem options for air pollution control and liquid effluent control	1,900
• Test at least ten innovative environmental technologies to provide recommendations to the technology developer relative to improving worker health and safety, efficiency, and productivity	2,400
Total, FY 1997 Program Support	$8,814

Explanation of Funding Changes FY 1996 to FY 1997

- Reduced level of effort and completion of major study efforts in FY 1996 in the areas of Cost Benefit Analysis studies, Systems Engineering Analysis studies, and field coordination groups.

Major Issues

- None

OFFICE OF ENVIRONMENTAL MANAGEMENT PROGRAM DIRECTION

I. **Mission Supporting Goals/Ongoing Responsibilities**:
Program Direction provides the overall direction and administrative support for the Environmental Management (EM) programs, including both Headquarters and field personnel. The role of the Headquarters work force is to determine and implement policy. To this purpose, EM Headquarters first establishes priorities and goals for the line programs, and then develops the baselines to assist in assessing the progress of planned activities. Subsequently, Headquarters personnel assess the adequacy of progress in order to report to Congress, interested stakeholders, and the public on the status of Environmental Management programs.

Headquarters activities include the management, coordination, tracking, and implementation of the EM Programs among the many sites throughout the DOE complex. In the field, Operations Office personnel are responsible for the oversight of the Department's contractor workforce that supports EM activities for the Department of Energy.

Program Direction has been grouped into four categories:

Salaries and Benefits provides for more than 3,000 Federal employees at Headquarters (employees based in the Washington, DC metropolitan area) and the ten major Operations Offices located throughout the United States, the Carlsbad Area Office and the Environmental Technology Centers located in Morgantown, WV and Pittsburgh, PA.

Travel includes all costs of transportation, subsistence, and incidental travel expenses of EM's Federal employees in accordance with Federal Travel Regulations.

Support services includes technical and administrative support, program management and integration, management information and support systems, performance systems, and cost/schedule studies. This also includes technical support for Systems Engineering and Analysis studies that focus on identifying technologies that merit further research and development, as well as implementation. Program Management includes support for organizational and strategic planning, coordination and interaction with other Federal and State agencies and private industrial concerns, performance measurement and cost assessment. Office Administration includes support for personnel development, training, travel, and logistics.

Other related expenses includes funding for building maintenance, rents, communications, utilities, computer/video support, printing and graphics, copying, postage, and supplies.

Public Law 104-46, Energy and Water Development Appropriations Act, Fiscal Year 1996
Public Law 104-106, National Defense Authorization Act of FY 1996

III. PROGRAM PERFORMANCE SUMMARY:

FY 1995 Measurable Performance Activities:

- Provided funding to support 720 FTEs at Headquarters, whose primary responsibility was to determine and implement policy for the Environmental Management Program.
- Provided funding to support 2,478 FTEs at the 10 Operations Offices and two Environmental Technology Centers. These FTEs provided oversight of the contractor workforce responsible for performing environmental management activities for the Department of Energy.
- Performed technical, managerial and administrative activities at Headquarters and operations offices.
- Provided funding for salaries, benefits, travel, training and educational activities in support of the Department of Energy Technical Leadership Development Program (TLDP) interns (21 FTEs utilized).

FY 1996 Measurable Performance Activities:

- Implement a major reorganization of the EM Headquarters personnel which flattens the organization by increasing the ratio of supervisors to employees from 1:4 to 1:10, meeting the Department's goal.
- Provide funding to support 676 FTEs at Headquarters, whose primary responsibility is to determine and implement policy for the EM Program.
- Provide funding to support 2,582 FTEs at the 10 Operations Offices and two Environmental Technology Centers. These FTEs provide oversight of the contractor workforce that supports environmental management activities for the Department of Energy.
- Continue to reduce support services at the headquarters and the field. Headquarters support services have been reduced by 41 percent from FY 1995 levels. Support services at the Operations Offices have been reduced by 12 percent since FY 1995.
- Provide funding for early retirement buyout bonuses and lump sum annual leave payments for 111 employees.
- Provide funding for salaries, benefits, travel, training and educational activities in support of the Department of Energy TLDP interns

FY 1997 Measurable Performance Activities:

- Provide funding for salaries, benefits, travel and other related expense to support 618 FTEs at Headquarters, a reduction of 58 FTEs from FY 1996 FTE levels (excluding TLDPs and Buyouts) ..... $ 62,853
- Provide funding for salaries, benefits, travel and other related expenses to support 2,510 FTEs at the 10 Operations Offices and two Environmental Technology Centers, a reduction of 72 from FY 1996 FTE levels. 251,668

2490

FY 1997 Measurable Performance Activities: (Cont'd)

• Continue to reduce support services at Headquarters, achieving a 50 percent reduction since FY 1995	55,070
• Provide technical support services to the operations offices, achieving a 39 percent reduction since FY 1995	64,586
• Provide funding for salaries, benefits, travel, training and educational activities in support of the Technical Leadership Development Program (TLDP) interns	4,230
• Provide funding for early retirement buyout bonuses and lump sum annual leave payments for 222 employees	8,104
Total FY 1997	$ 446,511

IV. Explanation of Funding Changes FY 1996 to FY 1997:

A net increase of $6,693,000 for salaries and benefits is the result of a decrease of $13,101,000 due to a reduction of 159 FTEs; an increase of $2,826,000 to support the transfer of 29 FTEs from the Bureau of Mines at the Environmental Technology Research Center; and an increase of $11,286,000 due to anticipated Federal pay raise, promotions and associated personnel benefits for 3,128 FTEs. An additional increase of $5,682,000 results from the reduced availability of unobligated balances in FY 1997 to support this account. Unobligated balances of $13,343,000 were available in FY 1996 and this balance will be reduced to $7,661,000 in FY 1997.

A decrease of $544,000 in travel for EM employees reflects the decrease in the size of the EM Federal workforce

An increase of $3,322,000 for the planned costs of buyouts is necessary to meet Strategic Alignment Initiative (SAI) end of year on board ceilings. SAI personnel ceilings necessitate the separation of 222 personnel in FY 1997.

A net decrease of $38,194,000 in support service contracts is the result of a $8,955,000 decrease in Headquarters support services and a $29,239,000 decrease in field support services contracts consistent with Congressional and Departmental initiatives. These reductions reflect a 14 percent and 31 percent decrease respectively.

An increase of $1,014,000 is needed to support the Department of Energy TLDP Interns. These interns are placed in rotational assignments across the Department and do not necessarily support the EM program.

Other related expenses have increased by $469,000 due, in part, to the increase of the EM's contribution to the Human Resources Working Capital Fund, which provides administrative support to Headquarters personnel previously funded by Departmental Administration. The increase reflects the allocation of common administrative services more appropriately to the recipient organizations.

V. Explanation of Average FTE Costs:

ALBUQUERQUE

	FY 1995	FY 1996	FY 1997
Funding	$19,505	$20,217	$19,565
FTEs	173.1	196.0	184.0
Cost Per FTE	$113	$ 103	$ 106

- Salaries and benefits have increased by $3,300 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Defense Programs is the landlord for the Albuquerque Operations Office. Funding for building maintenance, rents, communications, utilities, computer/video support, printing and graphics, copying, postage, and supplies are funded by Defense Programs.
- Support service contracts have decreased by $202,000, or $100 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses provides funding for costs associated with permanent changes of station, training and other contractual services. These costs have remained constant on an FTE basis.
- FTEs have decreased by 12 due to the Strategic Alignment Initiative downsizing efforts.

2492

CARLSBAD AREA OFFICE

	FY 1995	FY 1996	FY 1997
Funding	$5,075	$5,540	$6,265
FTEs	58.0	63.0	63.0
Cost Per FTE	$ 88	$ 88	$ 99

- Salaries and benefits have increased by $3,300 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Other related expenses includes funding for training activities. The cost per FTE has increased by $8,200 in FY 1997 due to the move of the Waste Isolation Pilot Project personnel to GSA space. The increase is related to rental payments and communications and utility costs. These expenses were funded by Defense Programs in FY 1996 and prior years.

CHICAGO

	FY 1995	FY 1996	FY 1997
Funding	$12,927	$9,201	$8,550
EML Funding	(3,000)	(1,400)	(3,000)
FTEs	91.7	102.0	104.0
EML FTEs	(40)	(44)	(52)
Cost Per FTE	$ 141	$ 90	$ 82

- Salaries and benefits have increased by $3,400 per FTE (excluding EML) in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Energy Research is the landlord for the Chicago Operations Office. Funding for building maintenance, rents, communications, utilities, computer/video support, printing and graphics, copying, postage, and supplies are funded by Energy Research.
- In FY 1997, EM will assume responsibility for the Environmental Measurements Laboratory (EML) from Energy Research. The EML is a government owned, government operated environmental research laboratory whose mission is to respond to the Department and other federal and international agencies regarding quality assurance, environmental and national security issues, and to conduct research on radioactive and other energy related pollutants that impact on human health and the environment. Energy Research will provide $3,600,000 for 36 FTEs in FY 1997. EM will assume full funding responsibility in the outyears.
- In FY 1996, EM's contribution for the EML was $1,400,000 which funds approximately 17.5 of the 44 FTEs associated with this program. EM will contribute $3,000,000 in FY 1997. Reimbursements from the Office of Nonproliferation and National Security, the U.S. Air Force and the U.S. Nuclear Regulatory Commission will also be used to fund this program.
- Support service contracts have decreased by $1,962,000, or $19,300 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses provides funding for training and other contractual services.
- FTEs have increased by 2 as EM provides additional support for the EML.

IDAHO

	FY 1995	FY 1996	FY 1997
Funding	$30,961	$28,992	$27,409
FTEs	280.8	272.0	259.0
Cost Per FTE	$ 110	$ 107	$ 106

- Salaries and benefits have increased by $3,500 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- All costs associated with rent, utilities, maintenance, computers, telecommunications are currently funded from the Departmental Administration account. These costs were approximately $23,300 per FTE in FY 1995. Due to reductions in the Departmental Administration funding, printing and supply costs will be allocated to the EM programs in FY 1996 and FY 1997.
- Support service contracts have decreased by $1,244,000, or $4,200 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses includes costs for the M&O contractor integration work provided to the Idaho Operations Office for activities relating to administrative activities. These costs for these activities have decreased since FY 1995.
- FTEs have decreased by 13 due to the Strategic Alignment Initiative downsizing efforts.

MORGANTOWN ENERGY TECHNOLOGY CENTER (METC)

	FY 1995	FY 1996	FY 1997
Funding	$ 3,772	$ 2,458	$2,332
FTEs	14.1	14.0	14.0
Cost Per FTE	$ 268	$ 176	$ 167

- Salaries and benefits have increased by $3,500 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $175,000, or $12,500 per FTE, as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses includes costs for other contractual services.

NEVADA

	FY 1995	FY 1996	FY 1997
Funding	$ 6,972	$ 7,395	$ 7,495
FTEs	57.3	61.0	60.0
Cost Per FTE	$ 122	$ 121	$ 125

- Salaries and benefits have increased by $3,000 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $317,000, or $5,000 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses includes funding for training and other contractual services. The increase between FY 1995 and FY 1996 is due to additional funding needed to support EM program laboratory advisors at a cost of $19,900 per FTE in FY 1996. This program was initiated in FY 1996 to provide Stakeholder involvement into site planning activities. An additional $6,100 per FTE is needed to support the laboratory advisors in FY 1997.
- FTEs have decreased by 1 due to the Strategic Alignment Initiative downsizing efforts.

OAK RIDGE

	FY 1995	FY 1996	FY 1997
Funding	$20,380	$20,835	$19,477
FTEs	155.7	171.0	156.0
Cost Per FTE	$ 131	$ 122	$ 125

- Salaries and benefits have increased by $3,300 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $260,000, or $300 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses provides support for rental payments, communications and utilities, computer/video support, printing, training, equipment purchases and maintenance, supplies and other contractual services.
- FTEs have decreased by 15 due to the Strategic Alignment Initiative downsizing efforts.

Explanation of Average FTE Costs; Program Direction -- Defense (Continued)

OHIO

	FY 1995	FY 1996	FY 1997
Funding	$22,703	$29,505	$28,450
FTEs	225.8	235.0	235.0
Cost Per FTE	$ 101	$ 126	$ 121

- Salaries and benefits have increased by $3,400 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $1,854,000, or $7,900 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses includes funding for GSA rental payments, communications & utilities, computer/video support, training, equipment maintenance, supplies and materials, equipment and other contractual support. Other contractual services have increased by $8,200 per FTE in FY 1996 due to the additional support services necessary to support the Mound Site.
- FY 1995 includes 39 FTEs transferred from Defense Programs for the Mound Site, however, no funding was transferred for these FTEs. This explains the lower cost per FTE in FY 1995.

OAKLAND

	FY 1995	FY 1996	FY 1997
Funding	$ 9,482	$10,346	$9,385
FTEs	78.9	85.0	80.0
Cost Per FTE	$ 120	$ 122	$ 117

- Salaries and benefits have increased by $3,200 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $739,000, or $7,600 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses provides support for rent, communications & utilities, computer/video support, training, operation and maintenance of facilities, supplies and other contractual services.
- FTEs have decreased by 5 due to the Strategic Alignment Initiative downsizing efforts.

Explanation of Average FTE Costs; Program Direction -- Defense (Continued)

PITTSBURGH ENERGY TECHNOLOGY CENTER (PETC)

	FY 1995	FY 1996	FY 1997
Funding	$ 332	$ 638	$3,589
FTEs	1.7	2.0	31.0
Cost Per FTE	$ 195	$ 319	$ 116

- Salaries and benefits have increased by $3,600 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- EM has gained 29 FTEs in FY 1997 due to the transfer of Environmental Technology Research Group from the U.S. Bureau of Mines.
- Travel costs are estimated to be $21,000 per FTE in FY 1996 and $5,000 per FTE in FY 1997. The high cost of travel is due to the travel requirements of the two PETC personnel that support the Western Environmental Technology Office (WETO) located in Butte, Montana. In addition to the travel of the two WETO FTEs, funds are budgeted for the travel of PETC Federal support personnel to cover the costs of necessary travel to Butte, Montana. Additional travel funding has been provided in FY 1997 for 29 FTEs transferred from the U.S. Bureau of Mines.
- Support service contracts have decreased by $50,000 for the WETO in FY 1997 as the program continues to review these requirements. This contract secures specialized technical support to integrate WETO research, development, demonstration, and testing activities in its mission to develop technology for all facets of its environmental mission. This includes conducting infrastructure and system studies. The support service contract in FY 1995 was in place for just the last three months of the fiscal year, resulting in lower costs in FY 1995.
- Other related expenses provides for supplies in FY 1996 and FY 1997. FY 1995 costs were higher due to the costs associated with moving one FTE from HQ to Montana.

RICHLAND

	FY 1995	FY 1996	FY 1997
Funding	$92,358	$83,203	$72,963
FTEs	537.5	543.0	517.0
Cost Per FTE	$ 172	$ 153	$ 141

RICHLAND (Cont'd)

- Salaries and benefits have increased by $3,300 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $9,186,000, or $15,400 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses provides for rent, communications and utilities, printing & reproduction, supplies and other contractual services.
- FTEs have decreased by 26 due to the Strategic Alignment Initiative downsizing efforts.

ROCKY FLATS

	FY 1995	FY 1996	FY 1997
Funding	$30,890	$48,828	$44,243
FTEs	276.6	290.0	286.0
Cost Per FTE	$112	$ 168	$ 155

- Salaries and benefits have increased by $3,400 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $5,195,000, or $17,100 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce. Responsibility for Rocky Flats transferred to EM in FY 1996 from Defense Programs. The increase in support service cost from FY 1995 to FY 1996 reflects this transfer of responsibility.
- Other related expenses provides for training and other contractual services.
- FTEs have decreased by 4 due to the Strategic Alignment Initiative downsizing efforts.

SAVANNAH RIVER

	FY 1995	FY 1996	FY 1997
Funding	$79,051	$75,520	$66,531
FTEs	526.5	548.0	521.0
Cost Per FTE	$ 150	$ 138	$ 128

- Salaries and benefits have increased by $3,200 per FTE in FY 1997 for a planned cost of living increase and associated increase in benefits.
- Support service contracts have decreased by $8,055,000, or $13,300 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- Other related expenses provides for communications and utilities, printing and reproduction, training, supplies and other contractual services. These activities were funded by Defense Programs in FY 1995. The landlord responsibility for this program has transferred to EM in FY 1996, which drives the increase in other related expenses over the FY 1995 level.
- FTEs have decreased by 27 due to the Strategic Alignment Initiative downsizing efforts.

HEADQUARTERS

	FY 1995	FY 1996	FY 1997
Funding	$162,254	$123,075	$117,923
FTEs	720.4	676.0	618.0
Cost Per FTE	$ 225	$ 182	$191

- Salaries have increased by $10,900 per FTE. This increase is, in part, the result of $3,600 per FTE for a planned cost of living increase and associated increase in benefits. The balance of the increase, $7,300 per FTE, is related to the reduced use of prior year balances in FY 1997. The Headquarters costs per FTE are based on the new budget authority, reduced through the use of unobligated balances. However, the magnitude of the offset varies in each year. In FY 1996 a total of $13,343,000 was used to offset the budget request, which resulted in an apparent lower cost per FTE. In FY 1997 the use of unobligated balances has been reduced to $7,661,000, a decrease of $5,682,000 from the FY 1996 level. This creates the appearance of a large increase in the cost per FTE from FY 1996 to FY 1997. In FY 1995 $23,121,000 of unobligated balances were available to support salaries and benefits.

HEADQUARTERS (Cont'd)

- Support service contracts have decreased by $8,955,000, or $5,000 per FTE, in FY 1997 as the program continues to review these requirements. The majority of the remaining support service costs provides technical expertise not available within the Federal workforce.
- The increase in other related expenses in FY 1996 and FY 1997 reflect EM's contribution to the Human Resources working capital fund and increased the cost per FTE by $3,400. The working capital fund provides support for the operation and maintenance of facilities in the Washington D.C. Metropolitan Area, printing, copying, computer/video support, utilities, telephones, DCAA audits, contract closeouts, supplies and postage. These services were previously funded from within the Departmental Administration account. The working capital fund was established by the Office of Human Resources to allocate costs of common administrative services to the recipient organizations.
- FTEs have decreased by 58 due to the Strategic Alignment Initiative downsizing efforts.

TECHNICAL LEADERSHIP DEVELOPMENT PROGRAM (TLDP)

	FY 1995	FY 1996	FY 1997
Funding	$1,500	$3,216	$4,230
FTEs	210	0	0
Cost Per FTE	$ 71	$ N/A	$ N/A

- The Technical Development Leadership Program (Interns) provides funding in support of this Departmental program. Funds are provided for 34 interns located at Headquarters and Operations Offices in FY 1996. There are no FTE ceilings associated with this program. The increase in FY 1997 assumes an additional 10 interns will be allocated to EM for funding purposes.

BUYOUTS

	FY 1995	FY 1996	FY 1997
Funding	$ 0	$4,782	$8,104
Anticipated #	N/A	111	222

- In order to meet the Departments Strategic Alignment Initiative, the FY 1997 request includes funding for early retirement buyout bonuses and lump sum annual leave payments to support 222 FTEs. Headquarters must reduce its workforce by 81 employees during FY 1997, and a total of $2,957,000 is necessary to cover the costs associated with these separations. This is an increase of $767,000 over FY 1996 costs. The ten Operations Offices will reduce their workforce by 141 in FY 1997, and a total of $5,147,000 is necessary to cover the costs associated with these separations. This is an increase of $2,555,000 over FY 1996.

NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE

PROGRAM MISSION

The Department of Energy (DOE) defense mission resulted in the development of numerous facilities throughout the complex dedicated to the production and storage of nuclear materials for various weapons systems. Starting in the late 1980's and continuing through the present time, the majority of these production facilities have been shut down. Initially, many production operations were temporarily suspended with the intention of returning to production in the near-term. With the end of the Cold War, it has become clear that most of these former defense production facilities are no longer required for their original mission, and they have been declared surplus.

As a result of these changes, the Department's mission has shifted from the production of nuclear weapons to the clean up of the former production complex. The physical and chemical nature of the various nuclear materials remaining in the facilities since the production effort ended are not appropriate for long-term storage and in their current form represent an unacceptable level of risk to site workers, the public, and the environment. The Office of Nuclear Material and Facility Stabilization was established to manage the activities related to surplus weapons complex facilities and to ensure the nuclear materials are placed in a form suitable for longer-term storage and to deactivate the facilities. The Department must stabilize these materials (i.e., produce a safer chemical and/or physical form of the material) to reduce the level of potential risks such as exposure to radiation, contamination of people and the environment, and criticality events.

Milestones have been established for the stabilization of nuclear materials, including various forms of plutonium, uranium, special isotopes, and spent nuclear fuel by the year 2002. These activities have been prioritized so that the most urgent risks are addressed first. Further, as nuclear materials are placed in a more stable (i.e., lower risk) form, the physical plant (i.e., buildings, production systems, machinery, and utilities) can be deactivated. Deactivation is the term used for a number of activities needed to prepare the facilities for decommissioning. Examples of deactivation work include de-energizing utilities, draining plumbing lines, removing fuel rods from nuclear reactors, and dismantling unsafe portions of equipment and buildings. The funds requested in this budget address the requirements to meet these essential stabilization milestones. It is also envisioned that the mission of the Office of Nuclear Material and Facility Stabilization's program mission, including deactivation of facilities, can be completed in the 2005 - 2010 timeframe.

In FY 1994 the Defense Nuclear Facilities Safety Board recommended (Recommendation 94-1) DOE develop a plan, on a high priority basis, to stabilize plutonium and other nuclear materials into forms suitable for safe "interim" storage. The Nuclear Materials Stabilization Task Group (NMSTG) is moving forward with a program to integrate complex-wide initiatives to manage nuclear materials stabilization activities. Through this program, the Department has committed to the stabilization of materials presenting the most urgent risk by May 1997, with lower risk materials being stabilized by May 2002, and all excess plutonium metal and oxide packaged for long term. The NMSTG has taken an integrated Department-wide approach to stabilization issues; evaluating and integrating facility stabilization capabilities; procuring standardized equipment to support plutonium oxide stabilization and packaging for long-term storage; and, focusing research and development efforts on the technical challenges facing stabilization.

PROGRAM MISSION - NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE (Continued)

Not surprisingly, the types and forms of materials present in former defense production facilities, as well as highly specialized equipment, represent safety and security concerns beyond those risks discussed above. The requirements for providing safeguards and security to prevent people from getting hurt and material and equipment from being diverted (e.g. by terrorist groups) are very costly both in human resources and dollars. An active program has been established to identify, plan, and accomplish projects that will safely store nuclear materials in a manner that will reduce these funding requirements. Specific guidance for Environmental Management's (EM) Safeguards and Security program is provided to ensure optimal, cost-efficient implementation of DOE safeguards and security policy. This responsibility has been realigned to the Office of Nuclear Material and Facility Stabilization, to align the funding and accomplishment of these tasks within the same office.

In the Office of Nuclear Material and Facility Stabilization's FY 1997 Congressional Budget submission, the following program activities have been realigned within the overall EM organization:

- o All landlord activities, the Mound and Pinellas sites, have been transferred to the new Office of Site Operations.
- o All Program Direction and support service contractor activities have been transferred to the Program Direction account being managed by the EM Office of Budget.
- o The entire Rocky Flats program has been transferred to the Office of Environmental Restoration.
- o The Spent Nuclear Fuel program has been transferred from the Office of Waste Management.
- o A portion of the EM Safeguards and Security program has been transferred from the Analysis, Education and Risk Management budget.
- o The C,P,R Reactors at Savannah River have been transferred to the Office of Environmental Restoration.

Some of the most noteworthy facilities and materials under the Office of Nuclear Material and Facility Stabilization program include:

- o 10 nuclear reactors
- o 7 high level radioactive processing buildings
- o 3,000 surplus buildings
- o 2,700 metric tons heavy metal of spent nuclear fuel
- o 38.8 million liters of acid containing radioactive contaminates
- o Several thousand kilograms of plutonium in various forms
- o 10,000 packages of plutonium materials and waste
- o 75 million curies of cesium and strontium

As these facilities and materials are stabilized and deactivated, the associated costs are greatly reduced. We are proposing legislation for privatization of facility deactivation, which will authorize contractor financing of deactivation projects, with the contractor being paid from savings in maintenance cost to the government. This could greatly reduce the outyear maintenance mortgage for our facilities, which will otherwise be several billion dollars over the next five years, by enabling earlier facility deactivation than would be possible based on budgetary restrictions.

2509

PROGRAM MISSION - NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE (Continued)

The surveillance and maintenance and stabilization/deactivation activities, including those associated with the reduction of the mortgage, are conducted with full participation of involved stakeholders. The interests of stakeholder groups encompass environmental protection, individual safety and proper management of surplus facilities located close to large metropolitan areas. These interests focus on activities with major facilities located in California, Idaho, South Carolina, Tennessee, and Washington.

The GOALS of the Nuclear Material and Facility Stabilization Program are to:

- o Reduce risks:
  - -- by aggressively stabilizing nuclear materials as implemented in response to Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1.
  - -- by addressing the need for DOE to stabilize and remediate certain liquids and solids containing fissile materials and other radioactive substances located in spent fuel storage pools, reactor basins, reprocessing canyons, and various other facilities once used for processing and nuclear weapons manufacture.
  - -- by the timely deactivation of surplus, contaminated facilities.
- o Lower the mortgage cost of doing business.
- o Complete the mission of the Nuclear Material and Facility Stabilization program in the FY 2005-2010 timeframe.

Examples of lowering the mortgage cost of doing business:

- o A requested increase of $39,000,000 for spent nuclear fuel to accelerate the path forward. To achieve the $350 million over 10 years savings over the original path forward, a front-end increase is necessary to enable timely completion of the new milestones.
- o We are spending $6,200,000 in FY 1997 to clean up and consolidate the Savannah River heavy water inventories. Once these efforts are complete (FY 2001) and the facilities are deactivated, outyear costs will be reduced about $10,000,000 annually.
- o By spending approximately $13,000,000 in FY 1997 and $9,500,000 in FY 1998 on B-Plant deactivation activities, surveillance and maintenance at the plant will be reduced from approximately $20,000,000 per year to less than approximately $2,000,000 per year. The plant then can be transferred to Environmental Restoration at the end of FY 1998, 4 years early, resulting in a savings of approximately $70,000,000.
- o By spending approximately $11,000,000 to complete deactivation activities in FY 1997, surveillance and maintenance at the PUREX facility will be reduced from approximately $24,000,000 per year to less than $2,000,000 per year. The facility can then be transferred to Environmental Restoration one year ahead of schedule, resulting in a savings of approximately $60,000,000.

PERFORMANCE MEASURES:

The following performance measures are utilized by both Headquarters and field personnel to evaluate the effectiveness and efficiency of the accomplishments of the Nuclear Material and Facility Stabilization program:

- o Accomplish 100 percent of the FY 1997 nuclear material stabilization commitments and other risk reduction activities.
- o Accomplish deactivation projects within (or better than) cost and schedule baselines.
- o Reduce the total number and associated cost of surveillance and maintenance actions.
- o Accomplish 100 percent of established milestones.

PROGRAM MISSION - NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE (Continued)

FISCAL YEAR 1997 BUDGET STRUCTURE

The Office of Nuclear Material and Facility Stabilization's program budget is contained in two appropriation accounts. The first appropriation, the Defense Environmental Restoration and Waste Management, focuses on activities related to the management and stabilization of weapons related facilities. The second appropriation, Energy Supply, Research and Development, focuses on DOE activities independent of the weapons related program.

Within each appropriation, the Nuclear Material and Facility Stabilization program accomplishes its mission by funding activities through various budget functions. The Defense Environmental Restoration and Waste Management appropriation funds activities in the following five categories:

1. Program Integration:

   Funds all activities that accomplish transition program and deactivation project planning. This category focuses on the planning, development, and generation of transition programs and deactivation project documentation and plans.

2. Surveillance and Maintenance:

   Funds all activities that maintain surplus and transferred buildings with required functions (i.e., surveillance and maintenance of fire, safety and life support systems, building support, and essential services as specified by Operational Safety Requirements). This category includes system/facility monitoring, corrective and preventive maintenance.

3. Stabilization/Deactivation Actions:

   Funds all activities that stabilize nuclear materials or that remove surplus materials, chemicals, and supplies including removal of hazardous, mixed, and radioactive wastes. These actions are undertaken to reduce or eliminate the risks posed by these materials and to reduce the cost of surveillance and maintenance.

4. Program Support:

   Funds all activities that provide technical expertise support to assist the Federal staff with its line management and oversight functions.

5. Spent Nuclear Fuel:

   Funds all activities associated with the management of DOE Spent Nuclear Fuel (SNF). These actions would include all activities that will stabilize vulnerable SNF, and store the SNF in a safe condition which is compatible with the permanent repository for an interim period of time (assumed to be 40 years). Eventually, all DOE SNF will be transferred to the permanent repository.

The FY 1997 Office of Nuclear Material and Facility Stabilization's budget reflects a scope of work utilizing prior year uncosted balances.

NUCLEAR MATERIAL AND FACILITY STABILIZATION
(Dollars in Thousands)

ALBUQUERQUE

I. Mission Supporting Goals and Objectives

The Albuquerque Operations Office manages seven sites in five states. The Office of Nuclear Material and Facility Stabilization program coordinates stabilization activities with the Albuquerque Operations Office at the Los Alamos National Laboratory (LANL) in New Mexico.

The LANL is a transuranic waste generator; it is responsible for certifying and storing transuranic waste on site. LANL treats some hazardous waste on site, and design is underway for a hazardous waste treatment facility.

LANL has been designated the lead laboratory for research and development efforts to support the DOE response to Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1. In this capacity, LANL provides solutions to complex-wide technical and operational issues associated with stabilization and storage of plutonium and other nuclear materials.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Surveillance and Maintenance	0	223	0	-223	-100
Stabilization/Deactivation Actions	0	15,945	16,000	+55	0
Program Support	0	55	0	-55	-100
TOTAL, Albuquerque	$ 0	$16,223	$16,000	$ -223	-1

NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE (Continued)

III. Performance Summary - Albuquerque (Continued)

FY 1995 Accomplishments
- No Activity.

FY 1996 Accomplishments (To Date and Planned)
- Conduct surveillance and maintenance for Technical Area (TA) 21 facilities.
- Develop long-term storage packaging criteria for plutonium.
- Provide research and development (R&D), engineering, safety analysis, procedures, and training support for the plutonium liquids stabilization effort at Rocky Flats.
- Conduct R&D on solid residue treatment alternatives, including salt distillation and magnetic separation.
- Implement a core technology program which supports the Office of Environmental Management's nuclear material stabilization mission.
- Provide technical expertise to program managers, Office of Nuclear Material and Facility Stabilization program reviews.

FY 1997 Planned Accomplishments
- Conduct R&D programs to define standards, procedures and methods for plutonium storage, packaging, surveillance and monitoring ..... $ 3,670
- Conduct R&D on stabilization process alternatives for plutonium oxide-like materials, solutions, salts, and combustibles 4,730
- Continue development of core technologies related to the fundamental chemistry and materials issues involved in nuclear materials stabilization 7,600

Total FY 1997, Albuquerque ..... $ 16,000

Explanation of Funding Changes FY 1996 to FY 1997:
- FY 1997 funding is not being requested for surveillance and maintenance and program support categories due to more effective prioritization of programmatic activities.

Major Issues:
- None.

2521

CHICAGO

I. Mission Supporting Goals and Objectives

The Chicago Operations Office manages the Nuclear Material and Facility Stabilization program activities at the Argonne National Laboratory-East (ANL-E) and the Brookhaven National Laboratory (BNL).

Argonne National Laboratory-East occupies a 1,700-acre tract of land located approximately 22 miles southwest of downtown Chicago in DuPage County, Illinois. The ANL-E is committed to conducting its research activities in a manner that complies fully with applicable Federal and State regulations governing worker health and safety and protection of the environment.

Brookhaven National Laboratory (BNL) is a multipurpose research and development laboratory located in central Suffolk County on Long Island about 60 miles east of New York City. The site occupies about 8.3 square miles, which is mostly wooded, except for a developed area of about 2.6 square miles. To fulfill its role as a multiprogram laboratory, BNL directs scientific and technical efforts, including low and high energy physics, life sciences, and nuclear medicine research. To support the research programs, BNL operates the Alternating Gradient Synchrotron, the National Synchrotron Light Source, and the High-Flux Beam Reactor. The BNL is located over an Environmental Protection Agency-designated, sole-source drinking water aquifer.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 0	$ 180	$ 0	$ -180	-100
TOTAL, Chicago	$ 0	$ 180	$ 0	$ -180	-100

III. Performance Summary

FY 1995 Accomplishments

o No Activity.

III. Performance Summary - Chicago (Continued)

FY 1996 Accomplishments (To Date and Planned)
o Develop site-wide transition strategies and site priorities, planning, budgeting, and performance measurement documentation.

FY 1997 Planned Accomplishments
o None.

Total FY 1997, Chicago ..... $ 0

Explanation of Funding Changes FY 1996 to FY 1997:
o FY 1997 planned facility transition activities are delayed due to risk-based prioritization ($-180).

Major Issues:
o None.

2523

IDAHO

I. Mission Supporting Goals and Objectives

The Idaho National Engineering Laboratory (INEL), established in 1949 as the National Reactor Testing Station, is situated on more than 890 square miles of the Snake River Plain in southeastern Idaho. Over the years, 52 reactors have been constructed and operated at the INEL. There are nine primary facilities at the INEL as well as administrative, engineering, and research laboratories in Idaho Falls, approximately 50 miles east of the site.

The Idaho Chemical Processing Plant (ICPP) was built in the 1950's to store and reprocess spent nuclear fuel from Government-owned reactors. Fuel receipts have averaged 40 metric tons total mass per year for the past 10 years. The facility has recovered more than $1 billion worth of highly enriched uranium, which was returned to the Government stockpile. In addition, an innovative high-level liquid waste process, known as calcining, was developed at ICPP.

The 200-acre plant underwent an ambitious modernization during the 1980's, when most major facilities were replaced by safer, cleaner, and more efficient facilities.

In the spring of 1992, the decision to end spent fuel reprocessing eliminated a major mission for the plant. It also prompted a lay-up of the Fuel Processing Restoration project and created the need to develop a comprehensive facility transition plan.

The Nuclear Material and Facility Stabilization program is responsible for facility deactivation and ICPP programs at the INEL. The deactivation program creates and maintains an inventory of contaminated and uncontaminated surplus facilities. It also conducts deactivation projects in the surplus facilities to transition the facilities into a safe, stable, low surveillance and maintenance cost position.

The ICPP program provides general facilities infrastructure support which includes long range planning, facility services, line item construction projects, and general purpose capital equipment to support deactivation, special nuclear fuel activities at the ICPP facility.

The Plutonium Focus Area is established to help identify and recommend solutions to both site specific and complex-wide technical and operations issues associated with plutonium stabilization and storage. Research and development activities directed toward resolution of stabilization and storage issues are coordinated through this focus area.

The spent nuclear fuel (SNF) program receives and stores Naval spent nuclear fuel and other DOE assigned spent nuclear fuel. Current focus of the program is on placing all spent fuel into interim dry storage and preparing the fuel for permanent disposition in a geologic repository. The INEL is the lead laboratory in coordinating the DOE complex wide national program.

II. Funding Schedule - Idaho (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 21,563	$ -1,716	$ 0	$ +1,716	+100
Surveillance and Maintenance	61,234	75,107	74,729	-378	-1
Stabilization/Deactivation Actions	5,029	10,271	13,523	+3,252	+32
Spent Nuclear Fuel	51,274	46,194	49,303	+3,109	+7
TOTAL, Idaho	$139,100	$129,856	$137,555	$ +7,699	+6

III. Performance Summary

FY 1995 Accomplishments

- Completed the deactivation of the CPP-601/602 main reprocessing facilities including uranium accountability, stabilizing 12,000 liters of liquid uranium inventory.
- Completed equipment flushing and surplus chemical disposition in the Flourinel Dissolution Process.
- Provided surveillance and maintenance for 10 surplus radioactively contaminated facilities.
- Demolished six surplus buildings at Test Area North and Central Facilities Area.
- Completed conceptual design for Rover uranium removal to remove a nuclear criticality hazard.
- Provided steam for 130 buildings, distributed 147,000 KWH/day of electricity, provided 2.5 million gallons of water, and performed maintenance on 80 pieces of major equipment and 350 instrumentation systems for the Idaho Chemical Processing Plant (ICPP).
- Provided facilities maintenance (8,000 orders/year), work control, and general services such as custodial, training, roads and grounds upkeep, and warehousing to 1,300 people and 130 buildings at the ICPP.
- Provided engineering, Environmental Safety and Health (ES&H) and Quality Assurance (QA) support to ICPP such as processing over 4,000 drawings, completing 4 steam safety and 10 fire system analyses, conducting documented surveillance of 130 buildings and 1,700 structures, conducting 400 design reviews and 10 audits, calibrating 500 instruments/dosimeters, and analyzing 1,700 bioassays, 1,200 whole body counts, and 170 dose assessments.
- Completed General Plant Project construction items to maintain a safe and cost efficient infrastructure at the ICPP such as ICPP Plant Street lighting replacement, health and safety upgrade to the ICPP cafeteria, potable water storage tank, and acid pump installation in the Liquid Effluent Treatment and Disposal Building.
- Completed an Operational Readiness Review for the CPP-651 Annulus Storage Area and initiated an operations/safeguards inventory of special nuclear material in the Unirradiated Fuel Storage Facility's south vault to ensure safe storage and management of the materials.
- Completed transfer of the second 189 fuel handling units (FHU) from CPP-603 north and middle basins to CPP-666, initiated Experimental Breeder Reactor-II (EBR-II) fuel transfers from CPP-603 south basin, and thereby met two major court order milestones.
- Closed out four unresolved safety questions (USQ) at CPP-603, and thereby restored all CPP-603 fuels to the current authorization basis.

III. Performance Summary - Idaho (Continued)

FY 1995 Accomplishments (Continued)

- o Completed video inspections of potentially degraded spent nuclear fuels including EBR-II, TORY-IIA, Buffalo Pulstar and GETR fuels; repackaged and/or re-stored TORY-IIA and EBR-II fuels in the CPP-603 south basin.
- o Continued surveillance and maintenance of building CPP-666, CPP-749, CPP-603, and Test Area North (TAN) spent fuel storage facilities.
- o Received and safely stored 60 Naval fuel shipments and 12 shipments of Advanced Test Reactor (ATR) fuel.
- o Continued support of the re-racking projects in building CPP-666 pools 1, 5, and 6.
- o Completed design of the dry canning facility needed to dry and repackage some Spent Nuclear Fuel (SNF) located in the CPP-603 south basin.
- o Completed inspection of the first generation dry storage wells at building CPP-749.
- o Completed phase I of seismic evaluation of the Irradiated Fuel Storage Facility (IFSF).
- o Issued three versions of the INEL SNF Management Plan to assist with response to the Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1 and provided the INEL with an overall plan for management of DOE-owned SNF.
- o Evaluated repository technology through the FY 1994 Performance Assessment, FY 1994 Waste Form Product Characteristics, and the FY 1995 Criticality Protocol.
- o Developed a National SNF Program documentation including the Program Plan, Strategic Plan, Technology Integration Plan, Office of Civilian Radioactive Waste Management (OCRWM) Interface, program directives and guidance, and management procedures.
- o Developed: an integrated SNF database system (ISNFDS) and published a manual; a System Engineering (SE) Management Plan; and an Office of Spent Nuclear Fuel Management Public Participation Plan and drafted INEL SNF Stakeholder Participation Plan.
- o Developed and obtained concurrence throughout the DOE complex on proposed path forward for Resource Conservation and Recovery Act (RCRA) applicability. Provided RCRA report to the Environmental Protection Agency (EPA).
- o Implemented, and maintained the SNF Commitment Tracking System (CTS).
- o Completed the Interim Dry Storage Plan which included transportation infrastructure requirements; led the Interim Dry Storage Working Group.
- o Completed the preliminary repository disposition requirements and performance assessment studies.
- o Addressed OCRWM issues resolution on first repository and provided technical leadership for EM-OCRWM subgroups.
- o Researched Nuclear Regulatory Commission (NRC) requirements and impact of compliance and requirements.
- o Issued the final SNF Programmatic Environmental Impact Statement (PEIS) and Record of Decision (ROD) and final Foreign Research Reactor (FRR) EIS.
- o Supported multi-purpose canister (MPC) activities.
- o Negotiated the Idaho Consent Order/Settlement Agreement on SNF between Idaho, DOE, and the Navy.
- o Started feasibility studies on development of the dual purpose canister dry storage system and a fuel characterization/drying/loading station to load SNF into the dry storage canisters.
- o Collected information and developed a prioritized list stating what SNF will be placed into dry storage first.

III. Performance Summary - Idaho (Continued)

FY 1996 Accomplishments (To Date and Planned)

- o Initiate deactivation of the Rover Dry End Process including the removal of up to 150 kilograms of uranium in graphite ash from the cells in order to remove the nuclear criticality risk.
- o Continue to provide required surveillance and maintenance for 10 surplus radioactive contaminated facilities.
- o Continue to provide steam for 130 buildings, distribute 147,000 KWH/day of electricity, provide 2.5 million gallons of water, and perform maintenance on 80 pieces of major equipment and 350 instrumentation systems for ICPP.
- o Continue to provide facilities maintenance (8,000 orders/year), work control, and general services such as: custodial, training, roads and grounds upkeep, and warehousing to 1,300 people and 130 buildings at the ICPP.
- o Continue to provide engineering, ES&H and Quality Assurance support to ICPP such as: processing over 4,000 drawings, completing 4 steam safety and 10 fire system analyses, conducting documented surveillance of 130 buildings and 1,700 structures, conducting 400 design reviews and 10 audits, calibrating 500 instruments/dosimeters, and analyzing 1,700 bioassays, 1,200 whole body counts, and 170 dose assessments.
- o Complete General Plant Project construction items to maintain a safe and cost efficient infrastructure, such as the CPP-602 Analytical Laboratory Upgrade, ICPP Sewer Line Extension, CPP-633 Paint Shop, and the CPP Paving and Road Replacement projects.
- o Complete the operational inventory of the special nuclear material in the Unirradiated Fuel Storage Facility (CPP-651) while continuing activities for the storage consolidation of materials at the INEL.
- o Initiate Title Design for the ICPP Electrical and Utility System Upgrade project and continue design of the Security Facility Upgrades Project.
- o Remove all SNF from the CPP-603 north and middle basins and continue removal of spent fuel from the south basin completing a major court ordered milestone three months ahead of schedule.
- o Continue surveillance and maintenance of CPP-603, CPP-666, CPP-749, and the TAN fuel storage facilities.
- o Begin funding Public Service Company of Colorado's (PSC) surveillance and maintenance costs for the Fort Saint Vrain (FSV) Irradiated Spent Fuel Storage Installation (ISFSI). Submit an application to the NRC to transfer the NRC operating license from PSC to DOE.
- o Continue receiving and storing Naval, Advanced Test Reactor (ATR), and other assigned fuels.
- o Perform Non-Destructive Examination (NDE) inspections on several samples of EBR-II canned SNF.
- o Develop a working system for NDE equipment and a prototype SNF NDE pulse-echo system for in-basin examination of canned SNF to determine as-stored condition. Complete feasibility testing of a SNF NDE digital radiography system to complement information obtained from the pulse-echo system. Test vacuum drying methods for heavily corroded SNF and effects of water-logged SNF during vacuum drying.
- o Continue to support the CPP-666 re-racking projects. Install and begin using pool 1 racks. Store pool 6 racks on site and prepare for installation.
- o Initiate repackaging of Naval fuels from aluminum baskets into stainless steel packages to allow for more efficient storage in more durable, corrosion resistant baskets in CPP-666.
- o Install and begin operation of the SNF canning station in the IFSF handling cave. Begin placing Advanced Reactivity Measurement Facility/Coupled Fast Reactivity Measurement Facility (ARMF)/(CFRMF) fuels into the dry IFSF.
- o Continue program coordination functions such as maintenance of the INEL SNF Management Plan, fuel performance assessments and waste form product characteristics, and the SNF characterization information database.

III. Performance Summary - Idaho (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

- Continue to update, publish and distribute: 1) National SNF Program documentation, including the Program Plan, Strategic Plan, Technology Integration Plan, OCRWM interface, program directives and guidance, and management procedures; 2) Interim Dry Storage Plan which includes transportation infrastructure requirements. Coordinate activities associated with the technical working group.
- Continue to develop repository criteria and performance assessment studies and an integrated National Environmental Policy Act (NEPA) compliance strategy.
- Complete the FRR EIS ROD.
- Initiate involvement in other NEPA activities such as Multi-Purpose Canister EIS and Repository EIS.
- Continue to coordinate stakeholder participation at the INEL and at the complex-wide level in support of the HQ-Spent Nuclear Fuel Management Office. Finalize an INEL SNF Plan for stakeholder participation; continue to support multi-purpose canister activities.
- Continue coordination of issue resolution/positioning for matters of SNF disposition and RCRA applicability path forward. Achieve final resolution and concurrence within DOE and EPA on RCRA applicability to DOE-owned SNF. Issue final report.
- Continue to address OCRWM issues resolution, particularly those associated with EIS, licensing and technical issues; maintain formal interface with OCRWM and remain active in working groups.
- Conduct NRC reviews and determine applicability to interim storage facilities.
- Qualify other sites to RE-033P, conduct Quality Assurance (QA) training, continue implementation and maintenance of QA program, perform assessments and working group coordination.
- Expand implementation of the SNF CTS to cover the entire DOE-SNF complex.
- Complete feasibility studies and initiate conceptual design for the dual purpose canister dry storage system and a fuel characterization/drying/loading station to load SNF into the dry storage canisters.
- Complete conceptual design for dual purpose canisters.
- Deploy EBR-II NDE system and determine water content in cans suspected to contain water. Determine fuel condition within the cans by detection of sludge in the cans.
- Obtain radionuclide content and decay heat numbers for a majority of INEL SNF types.
- Continue SNF drying studies; obtain results on drying aluminum plate fuel with heavy amounts of corrosion product and silt present.
- Complete test plan for material interaction tests in a radiation field to support future loading of highly degraded SNF into dual purpose canisters.
- Prepare material interaction coupons for installation into the ICPP IFSF at CPP-603.

III. Performance Summary - Idaho (Continued)

FY 1997 Planned Accomplishments	
Surveillance and Maintenance	
o Provide ongoing surveillance and maintenance for industrial safety structural and equipment preventative and corrective maintenance, procedure and quality support self assessments, nuclear criticality and contamination control within the deactivating facilities	$ 5,731
o Complete 110 continuous surveillance, preventive, and corrective maintenance activities to ensure the safe storage of special nuclear materials at the Unirradiated Fuel Storage Facility	852
o Continue to provide steam for 130 buildings at ICPP, distribute 147,000 KWH/day of electricity, provide 2.5 million gallons of water, and perform maintenance on 80 pieces of major equipment and 350 instrumentation systems	20,300
o Continue to provide facilities maintenance (8,000 orders/year), work control, and general services such as custodial, training, roads and grounds upkeep, and warehousing to 1,300 people and 130 buildings at the ICPP	6,443
o Continue to provide engineering support to ICPP such as processing over 4,000 drawings, completing 4 steam safety and 10 fire system analyses, maintaining 16,700 controlled distribution copies, and completing 6 facility models	10,858
o Provide on-going ES&H and Quality Assurance support to ICPP such as conducting documented surveillance of 130 buildings and 1,700 structures, conducting 400 design reviews and 10 audits, calibrating 500 instruments/dosimeters, and analyzing 1,700 bioassays, 1,200 whole body counts, and 170 dose assessments	9,734
o Initiate construction to replace deteriorating and insufficient systems: the ICPP Electrical and Utility System Upgrade project (to be completed December 2001), and the ICPP Security Facilities Upgrade Project (to be completed September 1998)	16,685
o Complete General Plant Project construction items to maintain a safe and cost efficient operation, such as the replacement of boiler feed water piping at the ICPP and consolidation of ICPP Utility Controls	4,126
Stabilization/Deactivation Actions	
o Complete 40 percent of the Rover deactivation project which includes removal of vessels, equipment, and special nuclear material from the Material Handling Cave to accomplish nuclear material stabilization commitments at Idaho and remove the nuclear criticality hazard	7,223
o Complete risk-based deactivation/closure of the Old Waste Calcining Facility at ICPP	2,300
o Provide management, administrative, and planning activities for the Plutonium Focus Area to address plutonium stabilization and storage issues	2,500
o Coordinate department-wide research and development programs in the areas of plutonium storage standards, stabilization processes, packaging, surveillance and monitoring, and core technologies	1,500

III. Performance Summary - Idaho (Continued)

FY 1997 Planned Accomplishments (Continued)

Spent Nuclear Fuel	
o Continue surveillance and maintenance of CPP-666, CPP-603, CPP-749, and TAN SNF storage facilities to ensure safe storage of SNF	$ 10,100
o Obtain the NRC license for operation of the FSV ISFSI. Transfer operation of this facility from PSC to the DOE	1,500
o Continue fuel movements out of the CPP-603 south basin and into storage in either CPP-666 or the IFSF to provide compliant storage for this fuel	6,285
o Continue receipt and storage of Naval, ATR, and other DOE assigned SNF	8,975
o Provide support activities for the SNF program such as necessary operator training, quality assurance engineering and inspections, corrosion monitoring program, core team planning and review of maintenance work orders, and instrument monitoring	4,479
o Continue to support the re-racking projects for the pools in CPP-666. Place pool 6 racks into operation	2,000
o Begin the CPP-666 water quality system major maintenance and equipment replacement work	3,500
o Continue to support the research and development efforts for dual purpose canisters and project support necessary to place a dual purpose canister spent fuel storage facility into operation by July 1, 2003	3,464
o Develop and implement policies, strategies, and programs to safely, effective, and efficiently manage current and future inventories of DOE-owned SNF and FRR SNF; identify and integrate requirements to assure safe existing storage, resolve vulnerabilities, achieve safe and secure interim storage, and prepare for ultimate disposition in a geologic repository; integrate program activities including the conduct of assessments, evaluations, and technical issues; participate in providing the program resources needed to assist in implementing the national SNF program; establish the INEL as the Department's Lead Laboratory for SNF which will direct the research, development and testing of treatment, shipment, and disposal technologies for all DOE-owned SNF	9,000
Total FY 1997, Idaho	$ 137,555

Explanation of Funding Changes FY 1996 to FY 1997:

- o The deactivation funding increase of $3,252,000 is a result of the INEL being designated as the lead laboratory for plutonium focus area. The focus area activities will help identify and recommend solutions to technical and operational issues associated with plutonium stabilization and storage identified by the Defense Nuclear Facilities Safety Board, Recommendation 94-1.
- o The increase in funding of $3,109,000 for the Spent Nuclear Fuel program is necessary to support the increased transfers of spent nuclear fuel from the Underwater Fuel Receiving and Storage Facility (Building 603) to the Future Analytical Support Team/Flourinel Dissolution Process (FAST/FDP) Storage Facility (Building 666). The number of anticipated transfers is approximately 540 in FY 1997, an increase of 340 from approximately 200 in FY 1996.

Major Issues:

- o None.

NUCLEAR MATERIAL AND FACILITY STABILIZATION
(Dollars in Thousands)

OAKLAND

I. Mission Supporting Goals and Objectives

The Oakland Operations Office manages operations at the Lawrence Livermore National Laboratory (LLNL).

The LLNL main site is an approximately one-square-mile facility located on flat land in the Livermore-Amador Valley, approximately 40 miles east of San Francisco, on the eastern border of the city of Livermore. This site has an interim status Resource Conservation and Recovery Act (RCRA) Part B Permit for a treatment, storage, and disposal facility for hazardous, mixed, and low-level waste. Past operations involving the handling of storage of hazardous materials at the main site have resulted in the release and subsequent migration of contaminates into soil and groundwater. The Office of Nuclear Material and Facility Stabilization's mission is to maintain six sodium facilities in a safe and sound condition while reducing their annual surveillance and maintenance costs.

These facilities perform a number of diverse research and development activities.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 234	$ 0	$ 0	$ 0	0
Stabilization/Deactivation Actions	0	1,500	0	-1,500	-100
Program Support	0	125	0	-125	-100
TOTAL, Oakland	$ 234	$ 1,625	$ 0	$ -1,625	-100

III. Performance Summary

FY 1995 Accomplishments
- o Provided required transition and deactivation planning for the transition of surplus facilities.

FY 1996 Accomplishments (To Date and Planned)
- o Procure capital equipment necessary to support the plutonium metal and oxides stabilization project.
- o Provide technical expertise to program managers in the analysis, development and integration of the Federal Facility Compliance requirements.

NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE (Continued)

III. Performance Summary - Oakland (Continued)

FY 1997 Planned Accomplishments

o None.

Total FY 1997, Oakland ..... $ 0

Explanation of Funding Changes FY 1996 to FY 1997:

o A decrease in deactivation funding of $1,500,000 is due to the completion of capital equipment purchases for the plutonium metal and oxide stabilization project.

o FY 1997 funding for program support is not being requested due to more effective prioritization of programmatic activities.

Major Issues:

o None.

NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE
(Dollars in Thousands)

OAK RIDGE

I. Mission Supporting Goals and Objectives

The Oak Ridge Operations Office manages the Oak Ridge National Laboratory (ORNL), the surplus enrichment plants at Oak Ridge, Tennessee, and the surplus high assay enrichment plant at Portsmouth, Ohio. The Oak Ridge Reservation is located 20 miles west of Knoxville, in eastern Tennessee.

The ORNL occupies several sites and covers approximately 2,900 acres in Melton and Bethel Valleys, 10 miles southwest of the city of Oak Ridge, Tennessee. The ORNL's mission is to conduct applied research and development (R&D) in support of DOE programs in fusion, fission, conservation, fossil, and other energy technologies and to perform basic research in selected areas of the physical and life sciences. The Office of Nuclear Material and Facility Stabilization's mission is to maintain more than 50 buildings in a safe and sound condition while reducing their annual surveillance and maintenance costs.

The mission of the Oak Ridge Spent Nuclear Fuel (SNF) program is to implement policies, strategies, and programs to safely, effectively, and efficiently manage the current inventory of spent nuclear fuel located at the Oak Ridge Reservation.

The Nuclear Material and Facility Stabilization program is responsible for planning and maintaining the isotope facilities in a safe, environmentally and economically sound condition until ready for decontamination and decommissioning.

Many of the facilities are contaminated and require continuous monitoring to assure public protection from unplanned radiation releases.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 0	$ 551	$ 357	$ -194	-35
Program Support	0	150	0	-150	-100
Spent Nuclear Fuel	1,900	1,280	1,380	+100	+8
TOTAL, Oak Ridge	$ 1,900	$ 1,981	$ 1,737	$ -244	-12

III. Performance Summary - Oak Ridge (Continued)

FY 1995 Accomplishments
- o Developed vulnerability action plans for the six identified Environmental Safety and Health (ES&H) vulnerabilities.
- o Closed out four of the six vulnerabilities including activities on Homogeneous Reactor Experiment (HRE) vulnerability.
- o Provided support for the preparation of the complex-wide Programmatic Environmental Impact Statement (PEIS) for SNF.
- o Prepared ORNL Five Year Program Plan for SNF.
- o Developed the Quality Assurance (QA) Program Plan.
- o Continued to update the SNF database.
- o Inspected solid waste storage area (SWSA) 5N storage positions.
- o Implemented the SNF QA Program.
- o Started modification of SWSA 5N SNF storage positions.
- o Transferred miscellaneous SNF to consolidated storage.

FY 1996 Accomplishments (To Date and Planned)
- o Develop budget documentation, project management and program plans, schedules, and cost estimates for surplus facilities .
- o Provide program planning and performance measurement guidance for surplus facilities.
- o Conduct program management activities.
- o Perform fuel inventory database maintenance and updates.
- o Continue the implementation of the SNF QA Plan.
- o Relocate/repackage SNF from SWSA 5N storage positions; upgrade and line the existing storage positions.
- o Provide support to ORNL SNF coordinating committee.

FY 1997 Planned Accomplishments

o Develop budget documentation, project management and provide program plans and performance measurement guidance, schedules, and cost estimates for surplus facilities	$ 357
o Resolve program vulnerabilities (e.g., completion of modifications to existing storage facilities)	700
o Consolidate SNF into adequate interim storage facilities	190
o Provide support to develop Environmental Assessments (EA) and EISs for SNF Program activities	120
o Continue to support and interface with the National SNF Program	70
o Provide systems engineering support activities	150
o Provide program management to coordinate SNF activities	150
Total FY 1997, Oak Ridge	$ 1,737

III. Performance Summary - Oak Ridge (Continued)

Explanation of Funding Changes FY 1996 to FY 1997:
o FY 1997 funding for the program support category is not being requested due to more effective prioritization of programmatic activities.

Major Issues:
o None.

NUCLEAR MATERIAL AND FACILITY STABILIZATION - DEFENSE
(Dollars in Thousands)

RICHLAND

I. Mission Supporting Goals and Objectives

The Richland Operations Office (RL) manages the Hanford Site, which is located on approximately 560 square miles (1,450 square kilometers) in southeastern Washington. Facilities at the Hanford site were among the first facilities constructed by the Manhattan Project. Historically, the emphasis of its operations has been on plutonium production, reactor and processing operations and research activities related to advanced reactors, energy technologies, and basic sciences. All production activities ceased in 1989, and today the emphasis is on managing the cleanup of the previously generated, stored waste, which is often referred to as legacy waste.

The Nuclear Material and Facility Stabilization program performs the following functions:
- Manages the former defense production and nuclear energy facilities on the Hanford Site in a safe, secure, and environmentally sound manner.
- Stores, manages, and disposes of the inventory of nuclear materials associated with the former defense nuclear facilities.
- Deactivates surplus facilities to reduce costly surveillance and maintenance and prepare facilities for final decommissioning.
- Expeditiously removes spent nuclear fuel from the K-Basin and transitions all Hanford spent nuclear fuel to low-cost and safe interim storage.

In December 1992, DOE ordered the permanent shutdown of the Plutonium-Uranium Extraction (PUREX) Plant. This was the beginning of a large-scale environmental cleanup effort to prepare the PUREX Plant for safe and efficient decontamination and decommissioning work. With the cessation of production activities at the Plutonium Finishing Plant (PFP), the mission has been to operate the plant as necessary to stabilize and prepare nuclear materials for long-term storage and support cleanout activities needed to improve facility safety.

The goal of the 300 Area Fuel Supply Transition is to shutdown 18 former N-Reactor fuel manufacturing and support buildings as soon as possible, while maintaining safety and compliance.

At the end of FY 1995, the B-Plant/Waste Encapsulation and Storage Facility (WESF) complex started the deactivation process. As part of that process, a permanent shutdown notice for the B-Plant facility was issued in October 1995 and planning was initiated to decouple WESF, an operating facility, from B-Plant, and to deactivate B-Plant. Deactivation of B-Plant will be conducted using the PUREX model while the WESF will become a model for safe storage of radioactive material.

Changes in Inventories	-73	0	-100	-100	N/A
TOTAL, Richland	$ 212,735	$ 297,321	$ 312,566	$+15,245	+5

III. Performance Summary

FY 1995 Accomplishments

- o Completed deactivation of UO3 Plant.
- o Completed 20 percent of the PUREX Deactivation project.
- o Initiated fuel transfer from PUREX to K-Basins.
- o Reduced contaminated area by 276,200 square feet, 55 percent of the total.
- o Flushed 41 vessels formerly used to process uranium and plutonium, 54 percent of the total.
- o Transferred 420,000 liters of uranium contaminated nitric acid, 58 percent of total inventory.
- o Transferred the entire 23,000 liters of solutions containing 9 kilograms of plutonium.
- o Completed cleanout of 7 gloveboxes in N Cell, Q Cell and the PR room, 37 percent of the total.
- o Deactivated 3,812 instruments and control panels, 42 percent of the total.
- o Recovered by remote control the entire 300 kilograms of spent fuel from dissolved cell floors.
- o Initiated Environmental Impact Statement (EIS) for Plutonium Finishing Plant (PFP) stabilization/shutdown.
- o Remediated the plutonium bearing ductwork in seismically unstable Plutonium Finishing Plant support facility.
- o Removed loose contamination from 110,000 square feet of space in duct level areas.
- o Completed thermal stabilization of approximately 236 items of reactive scrap containing 23 kilograms of plutonium to eliminate the backlog. inventory of organic sludge residues at PFP.
- o Completed transloading all of the chloride and fluoride containing solutions from 27 10-L containers to poly bottles for use as feed material for Environmental Technology Development.
- o Completed the 291-Z closed loop cooling system, the C132 hazardous material storage, and the 291-Z panel board upgrade.

III. Performance Summary - Richland (Continued)

FY 1995 Accomplishments (Continued)

- o Cemented 30 items of low plutonium content reactive scrap stored as sludge.
- o Completed PFP waste disposal and drainage containment projects and purchased plutonium thermal stabilization equipment, mass spectrometer, non-destructive analysis equipment, and replacement parts for the PFP.
- o Removed 10 kilograms of plutonium from glovebox bays and canyon floors. (Estimates indicated that up to 56 kilograms of plutonium still exists in PFP process lines.)
- o Completed the transfer of the entire 9,475 liters of carbon tetrachloride from PFP to a commercial industrial user.
- o Completed Building 304 concretion which included activities such as: disposed of 3,676 liters of solvent waste materials and removed 92 drums of contaminated pyrophoric waste.
- o Initiated deactivation at the 303-K and 333 Building.
- o Completed closure of 300 Area Solvent Evaporator and 304 Facility.
- o Provided surveillance and maintenance for 12 non-reactor related facilities (at the 300 Area).
- o Continued operation and maintenance activities at B-Plant/Waste Encapsulation and Storage Facility (WESF) to provide minimum safe storage for cesium/strontium capsules.
- o Unloaded 13 shipping casks of returned cesium capsules (197 units) from Denver to WESF and repackaged safety devices for return transfer.
- o Continued K-3 duct work cleanout effort.
- o Continued minimal activities in support of the conceptual design report for the ventilation systems upgrade project.
- o Provided capital equipment purchases to support B-Plant/WESF activities.
- o Developed and approved the Accelerated Path Forward strategy for removal of fuel from the K-Basin to a new Staging and Storage Facility by December 1999.
- o Developed Technical Baseline Document, Project Plan, and Project Management Plan.
- o Shipped initial fuel from K-Basin to Hot Cells for characterization.
- o Submitted Corrective Actions Report for Seismic Unresolved Safety Questions(USQ).
- o Completed preparation and installation of seismic barriers in the K-Basin and seismic barrier testing; sludge characterization sample demonstration and Seismic Barrier Readiness Assessment Review.
- o Reroofed 105 KE/KW buildings; completed design reconstitution (verification and validation of drawings for 105 KE/KW buildings).
- o Completed interim Hot Cell data evaluation reports of N-Reactor fuel at Hot Cells.
- o Provided technical support associated with the K-Basin Environmental Impact Statement (EIS).
- o Resolved K-Basins fissile material accountability issue in K East Backwash Pit.
- o Resolved K-Basin potential on exchanger hydrogen generation issue and maintained safe storage of 2,100 tons of spent fuel in K-Basins.

2538

III. Performance Summary - Richland (Continued)

FY 1996 Accomplishments (To Date and Planned)

- o Stabilize 12 gloveboxes, the remaining 63 percent of the total.
- o Remove the entire 3,200 kilograms of spent nuclear fuel from the PUREX.
- o Assess and reduce 35 percent of contaminated areas (53,000 square feet) at PUREX; 10 percent remaining.
- o Dispose of the entire inventory of 80,000 liters of radioactively contaminated organic solvent for PUREX.
- o Complete transfer of 308,000 liters of surplus uranium contaminated nitric acid from PUREX.
- o Initiate consolidation of the canyon heating, ventilation, and air conditioning (HVAC) systems exhaust paths from 11 to 1.
- o Conduct surveillance at the PFP to assess the condition of contaminated areas, 24,000 kilograms of plutonium-bearing materials, 18,950 liters of nitric acid, 37,900 liters of aluminum nitrate, and other residual process chemicals.
- o Complete thermal stabilization of high risk plutonium residue stored in PFP vaults.
- o Initiate cleanup of Building 303-F at the 300 Area Fuel Supply Transition.
- o Complete public review and comment on the EIS for stabilization of remaining unstable plutonium-bearing materials at PFP.
- o Provide minimum safe storage for cesium/strontium capsules located in the WESF while initiating deactivation of B-Plant.
- o Unload 2 shipping casks of cesium capsules (25 units) from ARECO in Lynchburg, Virginia.
- o Procure capital equipment to support B-Plant/WESF activities.
- o Complete K-3 duct work cleanout effort.
- o Continue planning on the conceptual design for the B-Plant ventilation systems upgrade project which is critical for deactivation.
- o Complete construction of the replacement facility for the 300-Area process sewer.
- o Complete Building 324 renovation to meet safety requirements.
- o Complete 313S Phase I portion of Waste Acid Treatment System (WATS) Resource Conservation and Recovery Act (RCRA) Closure field activities at the 300 Area Fuel Supply Transition.
- o Initiate and complete deactivation of Buildings 303-M, 303-G/B and Building 304 within the 300 Area Fuel Supply Transition.
- o Provide funding for the thyroid study as mandated in the Congressional language.
- o Operate K-Basin to maintain safe and compliant storage of the fuel until it is removed and placed into storage awaiting stabilization.
- o Develop and maintain an executable technical, schedule, and cost baseline consistent with the systems engineering technical basis.
- o Maintain two-way communication between stakeholders, the public, and Spent Nuclear Fuel (SNF) Project through proactive regulatory integration and public involvement; perform disposition of other Hanford needs to be consistent with national programmatic decisions.
- o Develop and maintain a Systems Engineering Plan that includes functional analysis to support Path Forward activities, development of functions and requirements, systems engineering management plans, and engineering integration; maintain interface control and integration support to develop an overall plan on characterization, packaging, transportation, and storage of Hanford SNF not stored in the K-Basin.
- o Complete K- Basin facility projects including repairs or replacement of minimal infrastructure systems at 100-K to meet DOE objectives associated with fuel removal. This includes recovery of systems associated with water supply, electrical system, fire protection, and maintenance support infrastructure.
- o Perform K-Basin material removal and cleanup activities including characterization of debris, sludge, fuel, and water.
- o Complete K-Basins EIS and basin walls painting - Dose reduction.

III. Performance Summary - Richland (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)
- o Initiate and complete design and Phase I construction of the Canister Storage Building (CSB); initiate CSB construction.
- o Initiate and complete Multi-Canister Overpack (MCO) process testing.
- o Start the manufacturing of the Cask/Transportation System.
- o Initiate and complete conceptual design for cold vacuum drying and for hot vacuum conditioning system processing equipment.

FY 1997 Planned Accomplishments

Program Integration
- o Provide required financial and program planning documents, such as Activity Data Sheets, Site Integration Planning, Progress Tracking System/Site Management System input and Multi-Year Program Plan, and submit sitewide system input ..... $ 1,979

Surveillance and Maintenance
- o Continue surveillance and maintenance activities at PFP, the 300 Area Fuel Supply, PUREX, and B-Plant including the surveillance of safety controls; maintenance of fire, safety and life support systems; building support and essential services to be performed as specified by Operational Safety Requirements (OSR). This also includes system/facility monitoring, corrective and preventive maintenance, and safeguards and security 98,511

Stabilization/Deactivation Actions
- o Initiate Phase II of WATS RCRA closure activities at the 300 Area Fuel Supply; obtain regulatory approval of RCRA closure plans; complete isolation of building 313S and complete non-RCRA shutdown activities 4,140
- o Complete the following deactivation activities at the Plutonium Finishing Plant (PFP): initiate stabilization of 4,800 liters of Plutonium solutions; initiate selected PFP terminal cleanout activities and stabilize reactive solids; complete design and reviews for vault storage upgrades in support of Defense Nuclear Facilities Safety Board (DNFSB) Recommendation 94-1 14,990
- o Complete all deactivation activities at PUREX; 100 percent of end-state activities which include: disconnecting all utilities, deactivating radiation/fire protection and monitoring systems, and consolidating HVAC and electrical systems for required ventilation and filtering 10,517
- o Complete the following deactivation activities at the B-Plant facility: deactivate 25 facility systems for organics inventory storage, remove and stabilize highly radioactive materials from process equipment and structures, stabilize canyon exhaust filters and eliminate surface contamination in surrounding environments, shutdown steam supply to eliminate costly reliance 7,529

Spent Nuclear Fuel
- o Continue to develop and maintain an executable technical, schedule, and cost baseline consistent with the Systems Engineering technical basis; maintain two way communication between stakeholders, the public, and the SNF Project through proactive regulatory integration and public involvement 9,616

III. Performance Summary - Richland (Continued)

FY 1997 Planned Accomplishments (Continued)

o Continue to develop and maintain a Systems Engineering Plan that includes functional analysis to support Path Forward activities, development of functions and requirements, systems engineering management plans, and engineering integration	$ 10,619
o Continue to perform K-Basin activities which include the operations of K-Basins to maintain safe and compliant storage of the fuel until it is removed and placed into storage awaiting stabilization	26,599
o Continue to perform K-Basin material removal and cleanup including characterization of debris, sludge, fuel, and water. (System acquisition for design and installation of debris and sludge removal systems are included. Operational support associated with this system acquisition is closely integrated with the Path Forward goals)	37,125
o Start the manufacturing of the initial Multi-Canister Overpack units, which are an integral step in accomplishing the expedited Path Forward	5,189
o Continue the manufacturing of the Cask/Transportation System that is required to support the expedited Path Forward fuel movement	12,363
o Start Phase II construction and Phase II facility equipment procurement to complete the required for K-Basin fuel removal	46,125
o Continue to perform disposition of other Hanford needs to be consistent with national programmatic decisions by maintaining interface control and integration support to develop an overall plan on characterization, packaging, transportation, and storage of Hanford SNF not stored in the K-Basin	328
o Perform fuel conditioning facilities design and other preconstruction activities to support the Accelerated Path Forward	27,036
Changes in Inventories	
o The FY 1997 funding request for the Richland program reflects an adjustment for changes in inventories based on programmatic requirements	-100
Total FY 1997, Richland	$ 312,566

Explanation of Funding Changes FY 1996 to FY 1997:

- o The decrease in program integration funding of $5,217,000 is due to the transitioning of facility specific planning activities to the individual transition projects within the Richland program.
- o The decrease in surveillance and maintenance funding of $14,281,000 reflects the deactivation of Plant Systems at PUREX.
- o The decrease of $2,457,000 in stabilization/deactivation actions is due to the purchase of high efficiency thermal stabilization muffle furnaces in FY 1996 at PFP.
- o The increase in funding of $39,000,000 for spent nuclear fuel is due to the acceleration of the path forward. To achieve the $350 million over 10 years savings over the original path forward, a front end increase is necessary to enable timely completion of the new milestones.

Major Issues:

- o In FY 1997 the thyroid study activity is not being budgeted within the Nuclear Material and Facility Stabilization program.

SAVANNAH RIVER

I. Mission Supporting Goals and Objectives

The Savannah River Site, located near Aiken, South Carolina, produced nuclear materials for defense purposes. As one of the Department of Energy's (DOE) larger sites, it includes five nuclear reactors, two chemical separations facilities, fuel and target fabrication facilities, tritium processing facilities, a heavy water rework facility, two high-level waste tank farms, low-level waste, storage and disposal facilities, a high-level waste treatment facility (Defense Waste Processing Facility), and the Savannah River Technology Center. In keeping with the Nation's nuclear weapons reduction initiatives, the Department has ceased production of nuclear materials and is now focused on stabilization of the nuclear material inventories and preparation of surplus facilities for eventual decontamination and decommissioning.

The Office of Nuclear Material and Facility Stabilization's mission is to stabilize nuclear materials and then to deactivate facilities to the point that minimal investment is necessary to maintain the facilities until they can be decontaminated and decommissioned. Stabilization means that something (processing from a liquid to a solid form, processing to remove activated waste streams, repackaging, etc.) must be done to the nuclear materials so that they pose significantly less risk to workers, the public, and/or the environment. Nuclear materials will be stabilized in the F-Canyon, FB-Line, H-Canyon, and HB-Line at Savannah River. Deactivation means that, once nuclear materials are removed from a facility, hazardous materials, such as chemicals, are removed from the facility; support systems, such as electrical distribution systems, are reduced to the minimum necessary to assure that there is little contamination or safety risk to workers, the public, and/or the environment. At this point, other support systems, such as fire protection, maintenance, Radcon support, etc. can be reduced dramatically. Deactivation will be occurring in the reactors, heavy water, fuel fabrication, and support facilities. It is the program's objective to comply with all National Environmental Policy Act (NEPA) requirements prior to stabilization activities.

The budget will continue to focus on the safe maintenance of facilities within the residual production complex both before and following stabilization activities, continue efforts to achieve and maintain compliance with all applicable laws, regulations, and Department of Energy Orders; and maintain progress toward improving the conduct of all remaining operations.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 514	$ 21,350	$ 0	$ -21,350	-100
Surveillance and Maintenance	0	379,109	312,865	-66,244	-17
Stabilization/Deactivation Actions	0	55,159	98,004	+42,845	+78
Spent Nuclear Fuel	6,062	6,527	22,700	+16,173	+248
Savannah River Site Transfer	581,913	0	0	0	0
TOTAL, Savannah River	$588,489	$462,145	$433,569	$ -28,576	-6

III. Performance Summary - Savannah River (Continued)

FY 1995 Accomplishments

- o Transfer of facilities due to mission change from defense-related activities to Environmental Management activities.
- o Spent Nuclear Fuel Project:
  - Transmitted Savannah River (SR) National Environmental Policy Act (NEPA) documentation to Sandia National Laboratory (SNL).
  - Provided dedicated technical advisors to support DOE-HQ/Office of Spent Nuclear Fuel.
  - Developed and integrated SRS technical input into the planning and implementation of the DOE Complex Spent Nuclear Fuel (SNF) Policy and Program Plans.
  - SRS site specific NEPA documentation provided for: 1) the preparation of a Environmental Assessment/Finding of No Significant Impact (DOE EA/FONSI) for initiating the acceptance of a portion of the Foreign Research Reactor (FRR) SNF considered critical to the U.S. Nonproliferation Policy; 2) the preparation of a DOE EIS (FRR SNF EIS) to support the establishment of a new U.S. Acceptance Policy for the FRR SNF; and 3) the postulated accident scenarios for the various handling and interim storage and treatment options as identified by DOE.
  - Initiated fabrication of a calorimeter for evaluating thermal properties of DOE research SNF.
  - Developed and validated the acceptance criteria for the alternative fuel container systems.
  - Modified and validated the existing heat transfer computability models for various FRR fuel configurations.
  - Developed preconceptual design studies for various interim "dry storage" alternatives to enable identification of the most cost-effective design approach for SRS, enabling the timely initiation of a Conceptual Design Report (CDR) upon DOE authorization of Key Decision (KD)#0.
  - Analyze alternatives for the environmentally responsible stabilization of materials in the existing basins.

FY 1996 Accomplishments (To Date and Planned)

- o Continue maintenance of fire, safety, and life support systems at facilities and maintenance of facility safety envelope.
- o Complete stabilization of 50,000 gallons of plutonium-239 solution in F-Canyon. The solution will be converted to metal.
- o Complete dissolving 139 metric tons of Mk-31 targets. The targets will be converted into solid forms suitable for safe interim storage.
- o Complete shutdown of the fuel fabrication facilities in M-Area.
- o Complete post-Cassini plutonium-238 processing.
- o Provide upgrades to existing facilities and equipment or construct new facilities/equipment to support operations. These include the disassemble basin upgrades, F&H Canyon Exhaust Upgrades, as well as capital equipment and general plant projects associated with fuel fabrication, reactors, heavy water, and chemical separation facilities.
- o Provide DOE oversight of contractor implementation of DOE programs at Savannah River by providing programmatic direction and guidance concerning scope, assessing contractor performance against schedule and cost baselines, assessing the adequacy of conduct of operations, auditing business practices, performing environment, health, safety, and security surveys, etc.
- o Provide security services at Savannah River.
- o Manage the forests and land resources on a 300 square mile site.
- o Provide baseline environmental information for 300 square miles.
- o Provide technical analyses/reports/surveillance for operations.
- o Purchase automated data processing major item of equipment - Radioactive Liquid Transport Cask ($3,500,000).

2543

III. Performance Summary - Savannah River (Continued)

FY 1996 Accomplishments (To Date and Planned) (Continued)

o Spent Nuclear Fuel Project:

- Provide required tasks to develop and integrate SRS technical input into the planning and implementation of a DOE Complex SNF Policy and Program Plan through coordination with Idaho National Engineering Laboratory, Argonne National Laboratory, Richland and Oak Ridge Operations Offices and other DOE organizations, as appropriate. This effort includes: capability assessments and scope estimates, position papers, reports, to support technically defensible alternative analyses, program decisions and work activities; provide support for preparation of the Departmental Level Standards and Requirements documents for SNF, including: a) revision of DOE Order 5820.2B "DOE Waste Management"; b) the development of SNF interim dry storage acceptance criteria; c) participate on technical working teams in the development and implementation and maintenance of the detailed complex implementation plans; and d) provide technical support to the DOE NEPA working team to develop and integrate SRS site specific NEPA documentation into the complex-wide assessments.
- Close out the analyses and laboratory testing necessary to demonstrate the technical basis for interim "dry storage" of highly enriched aluminum clad SNF's.
- Continue analyses and laboratory testing required to identify, evaluate, verify the feasibility, and define the bounding acceptance criteria for criticality control of the various alternatives identified for the interim dry storage of aluminum clad highly enriched uranium (HEU) fuels and the final geological repository performance acceptance criteria for the final waste forms.
- Provide technical and operational support necessary for the timely and cost-effective acceptance and management of FRR SNF, based on the Department's decision upon completion of required NEPA reviews.

FY 1997 Planned Accomplishments

o Surveillance and Maintenance

- Maintenance of fire, safety, and life support systems at facilities, maintenance of facility safety envelope, conduct more than 30,000 surveillance, 45,000 radiological surveys, etc $242,432
- Provide security services at Savannah River 48,000
- Provide upgrades to existing facilities and equipment to support operations 22,433

o Stabilization/Deactivation activities 98,004

-- Complete installation of equipment for demonstration project to package plutonium in accordance with DOE's new plutonium storage standard for greater than 50 percent assay material.
-- Complete removal of 358 MT of sludge from the K- and L-Reactor Disassembly Basins.
-- Begin stabilization of the Mark-16 and -22 spent nuclear fuel.
-- Complete dissolution of 324 cans of plutonium sand, slag, and crucible that are known unstable plutonium residues.
-- Begin repackaging and characterization of 800 cans of plutonium solids and mixed plutonium scrap in FB-Line .
-- Complete dissolution of 306 cans of plutonium sweepings/turnings.
-- Begin repackaging 369 cans of plutonium metal to meet new storage standard for greater than 50 percent assay material.
-- Complete stabilization of 13,300 liters of plutonium 242 solution in H-Canyon.
-- Complete removal and replacement of six existing F- and H-Canyon underground diesel oil storage tanks.
-- Complete installation of Americium/Curium vitrification equipment in F-Canyon.

2544

III. Performance Summary - Savannah River (Continued)

FY 1997 Planned Accomplishments (Continued)	22,700
o Spent Nuclear Fuel Project	
- Continue activities such as consolidation and implementation of work scope for authorization, cost and performance monitoring and reporting, and development of periodic program reviews for the timely and efficient involvement of senior Westinghouse Savannah River Company (WSRC) and DOE-SR management personnel.	
- Continue to execute tasks required for the integration of WSRC technical input into the planning and implementation of the DOE Complex SNF Policy and Program Plans, including: timely response to data calls and special projects as requested by DOE; input into the DOE complex spent fuel and facility databases and the involvement and education of SRS stakeholders.	
- Provide technical and operational support necessary for the timely and cost-effective acceptance and management of FRR SNF, should the Department decide to implement a new FRR SNF acceptance policy upon completion of the FRR SNF EIS.	
- Prepare pre-authorization documentation to support capital funding authorization for interim dry storage to include: 1) finalize generic procurement specification and issue dry storage facility Request for Proposal (RFP); 2) complete dry storage design criteria Research and Development (R&D) and initiate parametric validation; and, 3) complete conceptual design.	
- Continue development of alternative treatment and packaging technologies for aluminum clad SNF with specific focus on direct disposal and melt/dilute and poison technologies. Prepare stabilization flow sheet for consolidation and dilution of poisoning ($20,000,000).	
Total FY 1997, Savannah River	$ 433,569

III. Performance Summary - Savannah River (Continued)

Explanation of Funding Changes FY 1996 to FY 1997 - Savannah River

- The Savannah River budget reflects the Inspector General findings in FY 1996 concerning cost accounting standards, specifically in the surveillance and maintenance, stabilization/deactivation, and program integration activities. ($-27,749,000)
- A reduction of $17,000,000 due to complete stabilization of M-Area, shut down fuel fabrication operations, reduced manpower and subcontracts.
- An increase in funding of $16,173,000 to evaluate alternative disposal technologies for the aluminum-clad SNF.

Major Issues:

- None.

HEADQUARTERS

I. Mission Supporting Goals and Objectives

Headquarters role is to determine and implement policy. This is done through the establishment of priorities and goals for the program, and the development of baselines to assist in determining progress on a given activity. Subsequently, Headquarters assesses the adequacy of progress in order to report to Congress, interested stakeholders, and the public on the status of the Nuclear Material and Facility Stabilization program.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 552	$ 6,413	$ 2,394	$-4,019	-63
Program Support	525	0	0	0	0
TOTAL, Headquarters	$ 1,077	$ 6,413	$ 2,394	$-4,019	-63

III. Performance Summary

FY 1995 Accomplishments

- o Provided Headquarters-directed field activities to support independent technical expertise for Nuclear Material and Facility Stabilization program reviews.
- o Reviewed and updated the Surplus Facility Inventory and Assessment (SFIA) database.

FY 1996 Accomplishments (To Date and Planned)

- o Continue to provide funding to support program management plans and procedures, management support systems, and performance systems.
- o Provide Headquarters-directed field activities to support independent technical expertise for Nuclear Material and Facility Stabilization program reviews.
- o Review and update the Surplus Facility Inventory and Assessment (SFIA) database.

FY 1997 Planned Accomplishments

o Provide Headquarters-directed field activities to support independent technical expertise for Nuclear Material and Facility Stabilization program reviews	$ 1,597
o Conduct analysis of safeguards and security (S&S) activities and provide expert opinions to Environmental Management managers to optimize S&S implementation; review and evaluate site S&S plans for EM facilities to ensure that a cost-effective and appropriate S&S program is implemented	797
Total FY 1997, Headquarters	$ 2,394

III. Performance Summary - Headquarters (Continued)

Explanation of Funding Changes FY 1996 to FY 1997

- Headquarters technical expertise activities for the Nuclear Material and Facility Stabilization program are reduced due to more effective prioritization of programmatic activities.
- Initiate Safeguards and Security activities for $797,000 in the Nuclear Material and Facility Stabilization program.

Major Issues:

- None.

NUCLEAR MATERIAL AND FACILITY STABILIZATION
DEFENSE ENVIRONMENTAL RESTORATION AND WASTE MANAGEMENT
(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and Location of Project: Actinide Packaging and Storage Facility, Savannah River Site, Aiken, South Carolina

2a. Project No. 97-D-450 ADS# 6965-17
2b. Construction Funded

3a. Date A-E Work Initiated (Title I Design Start Scheduled: 1st Qtr. FY 1997)

3b. A-E Work (Titles I & II) Duration: 12 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- NONE
Total Project Cost (TPC) -- NONE

4a. Date Physical Construction Starts: 2nd Qtr. FY 1998

4b. Date Construction Ends: 3rd Qtr. FY 2001

6. Current Cost Estimate:
TEC -- $109,838
TPC -- $138,753

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$ 7,900	$ 0	$ 7,900	$ 7,514
1998	18,000	0	18,000	14,339
1999	39,800	0	39,800	34,864
2000	31,000	0	31,000	34,380
2001	13,138	0	13,138	18,741

Note: This project is within the "No Action" and "Upgrade in Place" alternative under consideration by the Department for the future storage of fissile materials. In addition, under the alternative of "Consolidation" at one site, this initial design effort would be applied either at Savannah River (a candidate site for the consolidated facility) or at another candidate site.

2555

1. Title and Location of Project:	Actinide Packaging and Storage Facility, Savannah River Site, Aiken, South Carolina (Continued)	2a. Project No.: 97-D-450 2b. Construction Funded	ADS# 6965-17

8. Project Description, Justification and Scope

The Department of Energy (DOE) committed, in the Implementation Plan, for the Defense Nuclear Facilities Safety Board (DNFSB), Recommendation 94-1 to meet the DOE Criteria, for Safe Storage of Plutonium Metal and Oxides (DOE-STD-3013-94) by May 2002. The existing Savannah River Site (SRS) Facilities are not sufficient or capable of meeting the commitments in the DNFSB 94-1 Implementation Plan; therefore the Actinide Packaging and Storage Facility must be constructed. SRS has determined that a new Actinide Packaging and Storage Facility is the safest (to the worker and environment), and the most economical option compared to the major modification and refurbishing of existing SRS facilities and to a "no action" option. A life cycle cost estimate demonstrated that a new Actinide Packaging and Storage Facility has the lowest total associated cost with a payback period of approximately 3.5 years.

The Actinide Packaging and Storage Facility will provide for thermal stabilization, repackaging, and safe, secure, cost-effective storage of the Special Nuclear Material (SNM) to meet DOE-STD-3013-94, Criteria for Safe Storage of Plutonium Metals and Oxides. The facility is to be a 40,000 square foot (approximately) structure constructed in F-Area consisting of a 23,000 sq. ft. (approximately) hardened structure containing the Material Access Area (MAA). The MAA will be bounded by a contiguous 17,000 sq. ft. (approximately) soft structure containing offices, heating, ventilation, and air conditioning (HVAC) support equipment, and other administrative functions and will be designed to meet all the applicable national standards and DOE Orders.

Specifically, the facility will consist of process areas and equipment for truck unloading/loading, material confirmation, shipping packaging and unpackaging, accountability measurements, safety evaluation, International Atomic Energy Agency (IAEA) inspections, repackaging, waste management, a vault room with automated accessible storage bays, and full support and administration functions. For vault surveillance and container handling, automation will be used to minimize exposure. Additionally, a bagless transfer operation will be used to minimize exposure for the transfer of SNM from the exiting containers to containers designed for interim storage.

Utilities and services required will include electricity, potable process water, chemical storage, steam, compressed air, standard and high-efficiency particulate air filtered ventilation, and communications.

FY 1997 funding will be used for Title I and II architectural and engineering activities.

2556

8. Project Description, Justification and Scope (continued)

This project will:

(1) Provide safe and secure interim storage for SNM until final dispositioning options are selected.

(2) Provide a cost-effective central storage facility to consolidate current SNM inventory which meets the DOE standard for storage of plutonium metals and oxides and the time table recommended by the DNFSB.

(3) Enable the deinventory of the canyon facilities and thereby reduce staffing and security requirements.

(4) Reduce worker radiation exposure by providing automation (where feasible) for container storage retrieval and positioning.

(5) Provide a location for IAEA inspection to meet non-proliferation objectives.

1. Title and Location of Project:	Actinide Packaging and Storage Facility, Savannah River Site, Aiken, South Carolina (Continued)	2a. Project No.: 97-D-450 2b. Construction Funded	ADS# 6965-17

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 18,028
1. Engineering, design, and inspection at approximately 17 percent of construction costs (item c) (Design, Drawings, and Specifications ($6,009,000)	$ 11,184	
2. Construction Management Costs at 6 percent of construction costs (Item c)	4,102	
3. Project management at 4 percent of construction costs of Item c	2,742	
b. Land and land rights		0
c. Construction costs		65,614
1. Improvements to land	6,304	
2. Buildings	28,715	
3. Other structures	1,327	
4. Utilities	3,386	
5. Special facilities	25,882	
d. Standard equipment		7,614
e. Major computer items		0
f. Removal cost less salvage		10
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		$ 91,266
i. Contingencies at approximately 20 percent of above cost		18,572
j. Total line item cost (Section 11.a.1[a])		$109,838
k. Less: Non-Federal Contribution		0
l. Net Federal total estimated cost (TEC)		$109,838

Department of Energy established escalation rates were used as provided in June 1995.

10. Method of Performance

A make-versus-buy analysis will be completed and as a result, design, construction, and procurement shall be accomplished by fixed priced contracts or by the Management and Operating (M&O) Contractor awarded on the basis of competitive bidding.

11. Schedule of Project Costs and Other Related Cost Requirements

12. Narrative Explanation of Total Project Costs and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
(a) Line Item--The line item TEC is $109,838,000.
(b) PE&D - None
(c) Expense-funded equipment--None.
(d) Inventories--None.

2. Other project costs
(a) R&D necessary to complete construction--$7,315,000.
These costs include development of the intermin storage container, the Bagless Transfer system, Laser Sampling system, Digital Radiography Inspection system, Vault Container Delivery system, Primary Container Welding, and Container Assay Equipment.
(b) Conceptual design--$729,000.
(c) Decontamination & Decommissioning (D&D)--None
(d) NEPA Documentation --$300,000.
(e) Other project related costs--$20,571,000.
These costs include technical support during design and construction, preparation of safety analysis documentation, preparation of operating procedures and operator training, startup testing, and execution of the Operational Readiness Review/Operational Readiness Evaluation (ORR/ORE).
(f) Non-Federal Contribution--None.

b. Related annual costs
(1) Facility operating costs--$16,600,000.
(2) Facility maintenance and repair costs--$2,500,000.
(3) Programmatic operating expenses directly related to the facility--None.
(4) Capital equipment not related to construction but related to the programmatic effort in the facility--$500,000.
(5) GPP or other construction related to programmatic effort--$500,000.
(6) Utility costs--$900,000.
(7) Other costs--None.

Total Estimated Cost (TEC)- None
Total Project Cost (TPC) -- None

4a. Date Physical Construction Starts: 1st Qtr. FY 1998

4b. Date Construction Ends: 2nd Qtr. FY 1999

6. Current Cost Estimate:
TEC -- $3,500 a/
TPC -- $5,300

7. Financial schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$ 1,500	$ 0	$ 1,500	$ 1,000
1998	2,000	0	2,000	1,860
1999	0	0	0	640

a/ This project is being transferred from the Waste Management program to the Nuclear Material and Facility Stabilization program. It is being submitted as a new project rather than a continuation of project 92-D-176 due to a major change in mission.

8. Project Description, Justification and Scope

Completion of this project will provide isolation of existing B-Plant canyon filters in order to meet the end point criteria for cleanout and stabilization. The project includes a replacement High-Efficiency Particulate Air (HEPA) filter system for the B-Plant canyon exhaust with a new above grade filter housing with changeable HEPA filter elements, including ductwork, utilities, instrumentation and controls. The existing underground HEPA filter system will be isolated from the remainder of the plant by installing barriers in the air duct, thereby isolating the largest mobile radiological source term within the facility.

The original B-Plant canyon ventilation system exhausted air directly to the environment via a 200-foot stack with no filtration. A sand filter was added in 1948. The first HEPA filter system was installed in the 1960s, with an array of filter elements installed in an underground concrete chamber. Before each filter reached the end of its life, a new chamber was built beside the previous filter. This process continued; the fourth HEPA filter system, designated "D Filter" is now in service, and the "E Filter" is standing by. Airflow through the retired filters is blocked by a water seal provided at the outlet of each filter, but all filters share a common inlet.

The radionuclides loading onto the fiberglass and plywood HEPA filters is estimated between 100,000 and 1,000,000 total curies, primarily 90Sr and 137Cs. The filter elements themselves provide questionable integrity due to their age and accumulated radiation dose. Concerns exist regarding the potential for migration of the radionuclides from retired filters to in-service filters, or the potential for release of the radionuclides to the environment in the event of an accident. The maximum potential onsite and offsite doses associated with an accidental release from the retired filters is ten times higher (0.18 rem offsite/456 rem onsite) than the doses associated with an accident involving the B-Plant canyon facility it serves (0.018 rem offsite/44.7 rem onsite).

The new filter system will use changeable filters which will not accumulate the high level of radionuclides that are present on the existing HEPA filters. Consequently, the worst case accident involving the new filter system would result in negligible doses to workers or public.

Water seals are used on the outlet side of the retired HEPA filters to prevent airflow through them. The water seals must be monitored and refilled routinely due to evaporation. Isolating the existing filter system and constructing a new filter system would preclude the need for water seals and eliminate the possibility of radionuclides release due to a failed water seal.

The Washington State Department of Health exercises authority over the design and construction of air cleaning systems associated with permitted stacks. That agency has expressed concern regarding the reliability of the water seals but has accepted the current configuration of retired filters with outlet water seals at B-Plant as long as the seals are assured through daily surveillance. Once the plant is inactive, however, daily surveillance will not be practical. The new filter system eliminates the use of water seals altogether.

25692

8. Project Description, Justification and Scope (Continued)

The new filter system will require less maintenance and surveillance than the existing system, resulting in reduced resource requirements. Currently, the retired filters require an operator to perform surveillance on water levels once per shift (approximately 3 man-hours per day). In addition, seals must be refilled due to evaporation. Refilling pumps requires entry into surface contamination areas and confined spaces, and requires approximately 16 man-hours per month. Surveillance requires at least one operator to be present at the plant; refilling the water seals requires two operators. Radiological technical support is required to perform periodic surveillance and to update radiation work permits for the areas requiring access.

The radionuclides content in the new filter system will be negligible, compared to a source term of approximately 750,000 curies in the existing HEPA filter system. Once the existing system is isolated, the potential for this release would no longer exist. Additionally, the new filter system will reduce airflow from 30,000 cfm to 10,000 cfm with a corresponding reduction in radionuclides deposition on the HEPA filters. Lower filter loading will result in less waste being generated.

The estimated gross annual cost of operating the project facilities upon completion is approximately $50,000. The primary elements of the annual operating costs are utility costs for operating the exhaust fans and inlet air pre-heater; and labor and material costs for daily surveillance of the new filter system, annual replacement of spent HEPA filters, bi-annual instrument calibration, and replacement of failed equipment (e.g. valves, heaters). The gross annual cost for operating the current B-Plant canyon ventilation is approximately $142,000.

FY 1997 appropriation will be used for Title I Design work.

2563

1. Title and Location of Project:	B-Plant Safety Class Ventilation Upgrades, Richland, Washington (Continued)	2a. Project No.: 97-D-451 2b. Construction Funded	ADS# RL-6626-1

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and Management costs		$ 1,000
1. Engineering design and inspection at approximately 35 percent of construction costs, Item c (Design, Drawings, and Specifications: $370,000)	$ 630	
2. Construction Management Costs approximately 12 percent of construction costs (item c)	210	
3. Project management at 9 percent of construction costs (item c)	160	
b. Land and land rights		0
c. Construction costs		1,800

5. Special facilities	140	
d. Standard equipment		0
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		0
h. Subtotal (a through g)		$ 2,800
i. Contingencies at approximately 25 percent of above costs		700
j. Total line item cost (Section 11a, 1[a])		$ 3,500
k. Less: Non-Federal contribution		0
l. Net Federal total estimated cost (TEC)		$ 3,500

2564

10. Method of Performance

The operating contractor shall provide technical direction, overall integration and operational support for this project.

Design and inspection shall be performed under a negotiated contract with the onsite engineer-constructor. To the extent feasible, construction and procurement shall be accomplished by fixed-price contracts awarded on the basis of competitive bidding.

Site preparation and installation of the isolation barriers and tie-in configuration to the existing filter system shall be by the onsite engineer-constructor due to the radiological dose and contamination potential at these location.

Note: This estimate is based on a completed conceptual design.

All costs include escalation based on the "Material and Labor Escalation Study," prepared by Kaiser Engineers Hanford, dated February 1994. Engineering: FY 1994-3.8%; FY 1995-4.2%; FY 1996-4.2%; FY 1997-4.5%; FY 1998-4.5%; FY 1999-4.9%; FY 2000-4.5%; FY 2001-4.4%; Construction: FY 1994-2.9%;FY 1995-3.4%; FY 1996-3.4%; FY 1997-3.4%; FY 1998-3.7%; FY 1999-3.5%; FY 2000-3.4%; FY 2001-3.1%.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. **Total project funding**
   (1) Total facility costs
      (a) Line item--Total cost of design procurement and construction of the project is $3,500,000.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.

   (2) Other project costs
      (a) R&D necessary to complete construction--None.
      (b) Conceptual design--$218,000 for the completed conceptual design.
      (c) Decontamination & decommissioning (D&D)--None.
      (d) NEPA documentation costs--Costs of $5,000 for a draft Exclusion determination form and the Information Bulletin, for the proposed upgrades to the B-Plant Ventilation System.
      (e) Other project related costs--$1,577,000 for operating contractor support for the Preliminary Safety Analysis Report, Value Engineering Report, site investigations, vent requirements study, Quality Assurance Program Plan, Project Management Plan, design reviews, Fire Hazards Analysis, construction support, close out and start up reviews, and operator training.

b. **Related annual costs**
   (1) Facility operating costs--$15,000 for approximately 360 man-hour/year routine daily surveillance for the new filter system and reduced surveillance of the retired system. The new filter system replaces the existing B-Plant canyon ventilation system filter building. These costs are approximately $77,000 less than the facility it replaces.
   (2) Facility maintenance and repair costs--$21,000 for approximately 160 man-hour/year for instrument calibration, filter changeout, flow penetration testing, and corrective maintenance including materials. These costs are approximately the same as the facility it replaces.
   (3) Programmatic operating expenses directly related to the facility--None.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--None.
   (5) GPP or other construction related to programmatic effort--None.
   (6) Utility costs--$14,000 for power to operate the project equipment including the exhaust fans, inlet air pre-heater, lighting and instrumentation. These costs are approximately $15,000 less than the facility it replaces.
   (7) Other costs--None.

1998	8,744	0	8,744	26,416

8. Project Description, Justification and Scope

This Major System Acquisition (MSA) project consists of all the activities necessary to safely stabilize and store approximately 2,100 metric tons of spent N-Reactor fuel currently stored at the 100 K East and West facilities. There are three specific subprojects within this MSA as follows:

a. Subproject #01 - Canister Storage Building (CSB) (W-379)

TEC	FY 1995	FY 1996	FY 1997	FY 1998	Outyears	Construction Start - Completion Dates
$79,530	$ 0	$38,900	$39,305	$ 1,325	$ 0	2nd Qtr. FY 1996 4th Qtr. FY 1998

1. Title and Location of Project:	Spent Nuclear Fuels Canister Storage Stabilization Facility, Richland, Washington (Continued)	2a. Project No.: 96-D-406 2b. Construction Funded	ADS# RL-6696-1

8. Project Description, Justification and Scope (Continued)

The Canister Storage Building (CSB) from Hanford's Waste Vitrification Plant (HWVP) Project will be modified to provide long-term, dry storage for spent fuel removed from the 100 K East and West basins. The facility will also serve as a staging area for the fuel prior to stabilization.

This facility is envisioned to consist of 2,900 square meters (31,580 square feet), of which approximately 2,310 square meters (23,160 square feet) will be available for storage and 590 square meters (6,420 square feet) for loading, handling and service areas.

Following hot conditioning, fuel returns to the Canister Storage Building where it will be placed, via a multi-canister overpack (MCO) handling machine, in storage positions and cooled by natural outside air circulation. The fuel could remain in storage for up to forty years or until a suitable repository becomes available. Following fuel removal, the facility will be deactivated and decommissioned.

Currently, spent Hanford N Reactor fuel is stored in unlined, concrete water-filled basins that are not seismically qualified and are located approximately 93.3 meters (100 yards) from the Columbia River. Any significant seismic event could cause a very serious hazard to the environment and potentially place the health and well being of the surrounding community in jeopardy.

Conditioning Facilities

Planned conditioning provides facilities and process equipment which reduces N Reactor spent nuclear fuel volatility in preparation for dry stockpiling at Hanford's Canister Storage Building (CSB).

These conditioning activities will consist of a cold vacuum drying and hot conditioning process.

Fuel conditioning is achieved by a process described in Hanford's July 1995 Spent Nuclear Fuel (SNF) Project Integrated Process Strategy for K-Basins. This strategy removes K-Basin spent nuclear fuel from existing storage canisters, washes the material to eliminate loose particulate (sludge), and reracks it into multi-canister overpacks (MCO'S) prior to removal from the Basins. Multi-canister overpacks then will be transferred to the Cold Vacuum Drying Module located in Hanford's 100 K area. Here bulk water is removed and the fuel vacuum dried. Next, those overpacks are transported to the Canister Storage Building, located in this site's central 200 area, where containers will be staged to wait for hot conditioning. A subsequent process removes chemically bounded water and decomposes uranium hydride, thereby preparing the fuel for storage. After hot conditioning, multi-canister overpacks are sealed and stored to await their final disposition.

2570

8. Project Description, Justification and Scope (Continued)

The FY 1997 appropriation will continue CSB construction; and design and construction activities of these conditioning facilities.

b. Subproject #02 - Cold Vacuum Drying Facility (W-441)

TEC	FY 1995	FY 1996	FY 1997	FY 1998	Outyear	Construction Start - Completion Dates
$16,076	$ 0	$ 2,300	$13,660	$ 116	$ 0	1st Qtr. FY 1997 3rd Qtr. FY 1998

A Cold Vacuum Drying Station receives each multi-canister overpack installed inside its transport cask. Overpacks will then be connected to a cold vacuum drying system while still residing in their casks. The cold vacuum drying system drains water from the multi-canister overpack and vacuum dries the fuel to remove all but chemically bounded water. Later, these overpacks will be transported to Hanford's Canister Storage Building (CSB).

FY 1997 appropriation will be used for the initiation of the Cold Vacuum Drying Facility Construction

c. Subproject #03 - Hot Conditioning Facility (W-484)

TEC	FY 1995	FY 1996	FY 1997	FY 1998	Outyear	Construction Start - Completion Dates
$15,810	$ 0	$ 800	$ 7,707	$ 7,303	$ 0	1st Qtr. FY 1997 3rd Qtr. FY 1998

Hot conditioning will take place in an annex contiguous with Hanford's Canister Storage Building (CBS). Multi-canister overpacks (MCO) are brought, by the Storage Building's MCO Handling Machine, to a work station where they are connected for hot conditioning. This conditioning process will consist of heating spent fuel to approximately 300 degrees celsius, and placing it under a vacuum which removes chemically bounded water and decomposes any uranium hydride. A passivation step may be added after the hot vacuum stage to reduce overall fuel reactivity. Following hot conditioning, multi-canister overpacks are returned to the Canister Storage Building via MCO Handling machine for placement into storage.

The FY 1997 appropriation will be used to perform Title I design work.

b. Related annual costs (estimated useful life of each facility--40 years Canister Storage Building, 3 years-Cold Vacuum Facility, and 2 years - Hot Conditioning Facility).

(1) Facility operating costs	$ 5,300 a/
(2) Facility maintenance and repair costs	0
(3) Programmatic operating expenses directly related to the facility	0
(4) Capital equipment not related to construction but related to the programmatic effort in the facility	0
(5) GPP or other construction related to the programmatic effort in the facility	0
(6) Utility costs	0
(7) Other costs	0
Total related annual costs	$ 5,300

a/ The estimated facility operating costs have been averaged over a 40 year total service life period.

2574

1. Title and Location of Project:	Spent Nuclear Fuels Canister Storage Stabilization Facility, Richland, Washington (Continued)	2a. Project No.: 96-D-406 2b. Construction Funded	ADS# RL-6696-1

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   (1) Total facility costs
      (a) Line item--$111,416,000 is the total estimated cost for the facility including the buildings, grounds and equipment and utilities.
      (b) PE&D--None.
      (c) Expense-funded equipment--None.
      (d) Inventories--None.
   (2) Other project costs (All costs are escalated to the year of expenditure)
      (a) R&D necessary to complete construction--NONE.
      (b) Conceptual design--Costs of approximately $3,362,000 to develop the scope of the project, design parameters, technical feasibility, and to improve the project cost and schedule estimates.
      (c) Decontamination & decommissioning (D&D)--NONE
      (d) NEPA documentation costs--$1,244,000. The Canister Storage Building will be discussed in the K-Basins EIS. The Record of Decision was due out in March 1996.
      (e) Other project-related costs--Costs of approximately $30,241,000 are expected to perform startup functions and to develop the functions and requirements, Safety and Regulatory, and validation documentation.

b. Related annual costs
   (1) Facility operating costs--Facility operating costs are expected to start in FY 1998 at $11,716,000, increase to $22,677,000 in FY 1999, then start to decrease to $13,835,000 in FY 2000 with continued decrease to about $1,800,000 in FY 1995 dollars over the next 37 years. The Canister Storage Building replaces 100 K area basins, which currently requires in excess of $44,000,000 to operate. The cost of the Canister Storage Building operations, both near and long term, are considerably less than the K-Basin operations costs.
   (2) Facility maintenance and repair costs--The facility maintenance and repair costs are included in the operating costs.
   (3) Programmatic operating expenses directly related to the facility--None.
   (4) Capital equipment not related to construction but related to the programmatic effort in the facility--None.
   (5) GPP or other construction related to the programmatic effort in the facility--None.
   (6) Utility costs--None.
   (7) Other costs--None.

1. Title and Location of Project: Electrical and Utility Systems Upgrade, Idaho Chemical Processing Plant, Idaho National Engineering Laboratory, Idaho

2a. Project No.: 96-D-464 ADS# ID-6329-WN
2b. Construction Funded

SIGNIFICANT CHANGES

- Total estimated cost decreased from $75,000,000 to $62,280,000 as a result of a reduction in scope.
- Total project cost decreased from $92,800,000 to $76,690,000 as a result of a reduction in scope.
- Construction of the sanitary sewer, potable water, and water meters has been removed from the scope of this project as a result of a re-evaluation of the Idaho Chemical Processing Plant needs versus requirements of infrastructure.

2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 2nd Quarter FY 1996

3b. A-E Work (Titles I and II) Duration: 30 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $75,000
Total Project Cost (TPC) -- $92,800

4a. Date Physical Construction Starts: 3rd Quarter FY 1997

4b. Date Construction Ends: 1st Quarter FY 2002

6. Current Cost Estimate: a/
TEC -- $62,280
TPC -- $76,690

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1996	$ 4,952	$ -440 b/	$ 4,512	$ 4,512
1997	10,440	0	10,440	9,376
1998	18,080	0	18,080	17,723
1999	13,400	0	13,400	14,398
2000	15,520	0	15,520	10,411
2001	328	0	328	5,422
2002	0	0	0	438

a/ The TEC and TPC has been reduced (TEC $75,000,000 to $62,280,000 and TPC $92,800,000 to $76,690,000). The reductions are a result of FY 1996 indirect cost reductions associated with Nuclear Material and Facility Stabilization productivity initiative, and deletion of the sanitary sewer, potable water, and water meter work scope.

b/ Directed reduction of $440,000 in FY 1996 to meet the uncosted reduction imposed by Congress.

2577

8. Project Description, Justification and Scope

The Electrical and Utility Systems Upgrade (EUSU) project will upgrade the Idaho Chemical Processing Plant (ICPP) electrical utility system by correcting high risk environmental, health, and life safety deficiencies. Correction of these deficiencies will reduce health and safety risks and provide safe and reliable utilities to support the ICPP mission. The ICPP electrical utility supply and distribution systems provide the infrastructure necessary to support plant operations. The system is outdated, overloaded, and not in compliance with DOE orders, or national codes and standards. These factors, combined with plant-wide growth, have utilized the capacity of the electrical distribution system and increased the potential health and safety risks associated with long-term use and maintenance of this ICPP utility system.

The scope of this project includes upgrades to normal and standby power/electrical systems. The system upgrades, improvements, and corrections listed in order of priority, include:

a. installation of a new 13.8 kilovolt-amperes (kVA) high voltage electrical ductbank and manhole system (approximately 17,000 linear feet) to correct high- low voltage separation code compliance and safety problems;
b. upgrading, relocating, or new installation of approximately ten 13.8 kVA substations and approximately ten load centers to eliminate overloaded conditions on existing electrical distribution equipment;
c. upgrading the existing standby power network and control system and installation of 1-2 new 1750 KVA (nominal) diesel generators to provide reliable standby power during commercial power outages to equipment that provides for containment and control of radioactive and fissile materials, environmental monitoring, security functions, or personnel and property protection;
d. replacement of approximately two hundred 20-40 year old panelboards and associated switchgear in 20-25 existing buildings that presently present a significant fire hazard;
e. reconfiguration of electrical service equipment in approximately 4-8 existing buildings to eliminate multiple electric service entrances that violate code and constitute fire response safety hazards;

The ICPP electrical utility system provides the infrastructure services required to support the safe operation and maintenance of the site facilities. The EUSU project feasibility studies and various Lockheed Idaho Technologies Company (LITCO) self assessment studies have shown that the electrical utility distribution system at the ICPP, because of its age, use, and rapid growth in utility requirements, is unsafe, unreliable, or violate DOE orders, DOE-ID A-E standards, and industry codes and standards, with significant health and safety implications. These utility systems are also rapidly approaching severe overload conditions. These high risk deficiencies, along with the system overload, jeopardize the ability of the electrical utility system to support the DOE mission at the ICPP to safely receive, inspect, store, and condition for disposal spent nuclear fuel and manage radioactive wastes generated from fuel handling activities while protecting the safety of the workers, the public, and the environment.

2578

8. Project Description, Justification and Scope (Continued)

The ICPP electrical power distribution system is approaching its design capacity. In April 1992, the ICPP power usage reached its highest level (13 MVA, 93 percent of rated 14 MVA capacity) since the plant began operations, even though all fuel processing has been discontinued. The capacity of the eight existing 13.8 kV feeders in the electrical power distribution system will be overloaded or at rated capacity by 1995. These feeders are expected to become overloaded as new facilities and equipment loads are added to support the new ICPP mission. The majority of the ICPP electrical manholes presently contain a mixture of high-voltage, low-voltage power, and low-voltage non-power (communication, alarms, security) circuits without proper separation, which is prohibited by the National Electric Code (NEC) and other safety codes. Several of the existing distribution centers exceed their rated capacities during peak load periods. Several load centers have insufficient electrical current interrupting ratings which constitute a potential explosion and fire hazard. In many facilities, power is supplied to many different locations within a building representing a hazard during a fire or maintenance activities. Many of the service entrance conductors and internal distribution panels are not adequately protected against short circuit conditions. Many panels, raceways, and conductors are not installed in accordance with safe NEC required practices. Two of the four primary standby generators have connected loads several times over their continuous ratings with expected maximum demand exceeding the rated capacities. Such deficiencies represent potential safety hazards to operational and maintenance personnel. Also, many of these 40 year old facilities have deteriorating and obsolete equipment with spare parts no longer available from suppliers.

Upgrades to the ICPP electrical utility distribution system is essential to: (1) provide for safe operation of site facilities vital to the ICPP mission, (2) provide a safe work place for employees, (3) minimize risk of property damage as well as damage to the environment, and (4) provide adequate capacity to support the DOE mission.

FY 1997 appropriation will be used for Title I design work.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
(a) Line item--The TEC is based on a detailed conceptual design cost estimate validated by a team of INEL cost estimators.
(b) Plant Engineering and Design--None.
(c) Expense-funded equipment--None.
(d) Inventories--None.
2. Other project costs
(a) R&D necessary to complete construction--None.
(b) Conceptual design--Spending in FY 1993, FY 1994, FY 1995, and FY 1996 include costs for feasibility studies, conceptual design, advanced conceptual design, project planning, cost and schedule planning, project plan and charter, project management plan, quality assurance program plan, project design criteria, special studies, and value engineering ($5,177,000).
(c) Decontamination and decommissioning (D&D)--None.
(d) NEPA documentation costs--An Environmental Checklist/Request for Categorical Exclusion was submitted in FY 1994. The NEPA Categorical Exclusion (CX) was approved March 7, 1994. No further NEPA funds are anticipated for this project ($83,000).
(e) Other project related costs--Funds are required to support the following activities: (1) project planning, (2) construction management planning, (3) QA/inspection planning, (4) project management for design support, construction support, testing, and startup, (5) safety analyses and reports, (6) readiness reviews for startup and operation, (7) operating tests, (8) training of operating and maintenance personnel, and (9) general technical support and software development ($9,150,000).

b. Related annual costs
1. Total facility operating costs include operating labor costs. Facility maintenance and repair costs include spare parts and maintenance costs.

2582

1. Title and Location of Project:	Security Facilities Consolidation, Idaho Chemical Processing Plant, Idaho National Engineering Laboratory, Idaho a/	2a. Project No.: 95-D-456 2b. Construction Funded	ADS# ID-6326-WN

SIGNIFICANT CHANGES

- Total estimated cost decreased from $18,500,000 to $15,100,000 as a result of a reduction in scope.
- Total project cost decreased from $22,732,000 to $18,901,000 as a result of a reduction in scope.
- As a result of a re-evaluation of the security system requirements at the Idaho Chemical Processing Plant, redesign of a single fence protected area, with one new Instrusion Detection System, will be installed/constructed saving an estimated $3.4 million.

1999	600	0	600	600

a/ A Baseline Change Proposal has been approved for the reduction of scope for the redesign of single fence protected areas, with one new Intrusion Detection System, for protection of Category I Special Nuclear Materials at the ICPP--project scope was revised to incorporate a graded approach when complying with DOE Orders.

2584

1. Title and Location of Project:	Security Facilities Consolidation, Idaho Chemical Processing Plant, Idaho National Engineering Laboratory, Idaho (Continued)	2a. Project No.: 95-D-456 2b. Construction Funded	ADS# ID-6326-WN

8. Project Description, Justification and Scope

This project will construct new facilities and install new equipment to support the ICPP security organization by resolving DOE Order compliance (DOE Orders 5632.1C and 5500.3A), inspection and evaluation findings, and address life expectancy/life cycle replacement concerns. The project will also accommodate changes to the ICPP mission, decrease plant operating costs, and support environmental remediation projects.

During the mission execution of the Idaho Chemical Processing Plant (ICPP) Category I and II quantities of Special Nuclear Material (SNM) will be consolidated at two existing ICPP storage facilities. The project will construct two new Protected Area security perimeters, complying with DOE Order 5632.2A at the existing storage facilities. Security perimeters will include guardhouses, a central alarm station (CAS), complementary intrusion detection systems at each perimeter, security fencing, lighting systems, vehicle barriers, a closed-circuit television system for alarm assessment, and a security alarm control system (SACS) to monitor all security sensors and assessment systems. Guardhouses will provide space for access control equipment to monitor personnel and vehicular access into the Protected Areas, and will be served with standard utilities. Construction of new security upgrades at these two locations will allow deactivation, by this project, of the existing security perimeter surrounding the overall ICPP site. Classified interests located outside of the new Protected Areas will be consolidated at approximately six existing facilities.

The SACS will monitor, control, and assess security alarms and video information received from new intrusion detection and CCTV systems located in the Protected Areas, and existing security systems throughout the ICPP. The SACS will consist of redundant computers, video assessment equipment (cameras, monitors, controllers, recorder, switches, fiber-optic distribution), and alarm system interfaces. Security lighting will be installed at the new Protected Areas to support CCTV operations and security inspections. Security systems will be supplied with commercial, optional standby, and uninterruptible electrical power.

Three existing access control facilities at the present ICPP Protected Area security perimeter will be remodeled to function as Property Protection Area entrances. These facilities will support required security inspections, provide a radiological contamination control point, and support personnel accountability during emergency evacuations.

Existing security lighting, intrusion detection and assessment systems, and the SACS have reached their design life expectancies and require life cycle replacement. System manufacturers no longer support the dated equipment with service contracts or provide replacement spare parts. Studies, including General Accounting Office report GAO/RCED-95-183, indicate that this project will reduce security operating costs at the ICPP by approximately $3,900,000 per year and result in a project payback period of five years.

FY 1997 appropriation will be used for Title I and II design work.

1. Title and Location of Project: Security Facilities Consolidation, Idaho Chemical Processing Plant, Idaho National Engineering Laboratory, Idaho (Continued)

Total related annual costs	$ 1,820

25287

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item--The TEC is based on a detailed conceptual cost estimate, dated February 4, 1994. Estimate is based on conceptual drawings, vendor quotations, experience gained from prior security-related projects, and work defined by the Conceptual Design Report.
   (b) Plant Engineering and Design--None.
   (c) Expense-funded equipment--None.
   (d) Inventories--None.
2. Other project costs
   (a) R&D necessary to complete construction--None.
   (b) Conceptual design--An estimated $2,279,000 was spent on the following activities: Conceptual design, advanced conceptual design, project management plans, quality assistance program plan, feasibility studies, value engineering, and project design criteria. Conceptual design costs include costs of redesign resulting from changes to project work scope and costs for installation of security items for testing and evaluation purposes.
   (c) Decontamination and decommissioning (D&D)--None.
   (d) NEPA documentation costs--$61,000 was spent on the: Environmental checklist/categorical exclusion, air quality permits, and permits to construct.
   (e) Other project related costs--An estimated $1,461,000 will be spent on the following activities: (a) testing and startup support, (b) readiness reviews for startup and operation, (c) operating tests, (d) training of operating and maintenance personnel, and (e) technical support.

b. Related annual costs

Total facility operating costs include operating labor costs. Facility maintenance and repair costs include spare parts and maintenance costs. Programmatic operating expenses directly related to the facility include SACS software maintenance fee. Utility costs are estimated at $20,000.

1998	11,290	0	11,290	11,290

a/ It should be noted that this project is justified as an operating expense funded project data sheet prepared to comply with the reviewed DOE Order 5100.3.
b/ Estimates of project costs are based on conceptual design.

2590

1. Title and Location of Project:	Americium/Curium Vitrification, Savannah River, South Carolina (Continued)	2a. 96-EXP 2b. Operating Expense Funded

8. Project Description, Justification and Scope

This project proposes the vitrification of the F-Canyon americium/curium (Am/Cm) solutions into borosilicate glass via a melter to be installed in the Multi-Purpose Processing Facility (MPPF) of the 221 F-Canyon. This project would provide for the development and design of the vitrification process, the design of the associated building infrastructure interfaces and the construction and installation of the equipment. This project would provide for the refurbishing of the existing MPPF facility to accommodate the new equipment.

Approximately 15,000 liters of solution containing the valuable isotopes 243 Am and 244 Cm have been accumulated in the 221 F-facility from recovery campaigns that began in the mid-1970s. These solutions have been identified in several documents as a vulnerability and as such require stabilization. These documents include the Defense Nuclear Facilities Safety Board Recommendation 94-1 and the Plutonium Environment, Safety and Health Vulnerability Assessment Report. There is no reasonable method to transport this material in solution from outside of F-Canyon. Due to intense radiation source of the material, a heavily shielded, remotely operated facility is required for handling and processing. There is no existing operable process to convert this solution to a solid form for safe storage or transport to the National Heavy Element and Advanced Neutron Sources (ANS) Programs at the Oak Ridge National Laboratory. An analysis of several alternatives has resulted in this project to develop the process to stabilize the solutions by vitrification into a glass form. The facility most suitable for installing vitrification equipment to stabilize this solution is the MPPF.

The FY 1997 funds will be used for the completion of Title II design and initial facility construction.

(a) R&D necessary to complete construction--Includes cost associated with the development of the vitrification process ($2,900,000).
(b) Conceptual design--The conceptual design was completed in November 1995 at a cost of $300,000.
(c) Decontamination & decommissioning (D&D)--None.
(d) NEPA documentation costs--Includes cost associated in complying with NEPA 1969 ($100,000).
(e) Other project-related costs--Includes all costs associated with the process development, training, procedures and facility support during construction of the project including Radcon protection.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. **Related annual funding**

1. Facility operating costs--The operating life of this facility will be approximately 6 months. The staffing costs associated with this are expected to be $2,400,000 (12 FTEs).
2. Facility maintenance and repair costs--The costs for maintenance are expected to be approximately $100,000.
3. Programmatic operating expenses directly related to the facility--None.
4. Capital equipment cost not related to construction but related to the programmatic effort in the facility--None.
5. GPP or other construction related to the programmatic effort in the facility--None.
6. Utility costs--Costs will not exceed $100,000.
7. Other costs--None.

POLICY AND MANAGEMENT
PROGRAM MISSION

The Policy and Management activity provides the other contractual services funding required to plan, direct, and manage the Department's Environmental Management (EM) program. Program activities encompass the Administrative Support area including support for the Assistant Secretary's staff, other contractual services necessary to accomplish program activities that include overall management; acquisition of education and training activities for the entire EM program; and environmental policy recommendations and planning activities. Included in this decision unit is other contractual services funding for the Offices of Strategic Planning and Analysis, Stakeholders Affairs, and Safety and Health. The Office of Safety and Health was transferred from the Compliance and Program Coordination decision unit, and now reports directly to the Assistant Secretary. The balance of the decision unit was previously funded in the Analysis, Education, and Risk Management decision unit. Almost twenty-five percent of the FY 1997 request is transferred to the field to fund activities; such as, Native American grants, site specific Advisory Boards, and public participation.

2596

The GOALS of Policy and Management are to:

- strengthen partnerships with stakeholders
- open the decision-making process
- maintain a total life-cycle program cost estimate that will increase public confidence that tax dollars are being spent effectively and efficiently
- improve the system so that it is under control managerially and financially

The OBJECTIVES related to these goals are to:

- reduce information resource management and local area network costs
- improve the records management system
- reduce costs for travel, and indirect costs on management contracts
- develop and implement monthly consolidated financial reports
- improve the Headquarters award fee process
- improve customer satisfaction

PROGRAM MISSION: POLICY AND MANAGEMENT (continued)

PERFORMANCE MEASURES:

Performance measurement efforts are focused on processes such as management information and data systems development and contract reform, as well as ensuring that an adequate and competent workforce is restructured to better accomplish the mission. Improvements will focus on customer satisfaction and productivity efficiencies. Specific example performance measures are:

- Increased overall customer satisfaction
- Improved technical competencies
- Reduced costs of operations
- Limit information systems downtime to less than five per cent
- Reduce Headquarters support service contract costs

POLICY AND MANAGEMENT

Program Performance Summary

I. Mission Supporting Goals and Objectives

The Policy and Management activity provides for the other contractual services funding required to plan, direct, and manage the Department's Environmental Management (EM) program. Program activities encompass the Administrative Support area including support for the Assistant Secretary's staff; other contractual services necessary to accomplish program activities that include overall management; acquisition of education and training activities for the entire EM program; and environmental policy recommendations and planning activities. Included in this decision unit is other contractual services funding requested for the Offices of Strategic Planning and Analysis, Stakeholder Affairs, and Safety and Health.

II. Funding Schedule:

Activity	FY 1995 Comparable	FY 1996 Comparable	FY 1997 Request	$ Change	% Change
Stakeholder Affairs	$ 4,848	$ 8,788	$ 10,500	$ + 1,712	$ + 19

III. Performance Summary

STAKEHOLDER AFFAIRS

The Office of Stakeholder Affairs is responsible for coordinating all activities necessary to include a maximum level of public involvement in major EM decisions.

FY 1995 Accomplishments

- Established nine Site Specific Advisory Boards.
- Redirected the EM Advisory Board and the State and Tribal Government Working Group to more focused groups meeting more frequently.
- Designed, implemented, and evaluated the EM Public Participation Training Program.
- Established and coordinated quarterly meeting of public participation coordinators.

FY 1996 Accomplishments (To Date and Planned)

- Manage eleven Site Specific Advisory Boards.
- Ensure the continued effectiveness of the EM Advisory Board and the State and Tribal Government Working Group.
- Complete evaluations of EM advisory boards and EM's public participation program.
- Work with EM program offices to organize five national stakeholder debates/symposia on key EM issues.
- Expand the use of innovative communication technology to encourage stakeholder involvement, such as a World Wide Web page and increased teleconferencing.

FY 1997 Planned Accomplishments

• Manage eleven Site Specific Advisory Boards	$ 5,500
• Manage the EM Advisory Board and the State and Tribal Government Working Group	1,600
• Coordinate EM Public Participation Training Program and public participation efforts for the FY 1998 budget process	199
• Host five national stakeholder debate symposia on key EM issues	550
• Expand the use of innovative communication technology to encourage stakeholder involvement	750
• Manage 19 Native American Cooperative Agreements	1,901
Total, FY 1997 Stakeholder Affairs	$10,500

TRAINING AND EDUCATION

The predominant portion of the Training and Education program provides for the development of technical and professional training courses EM-wide for 3,000 Federal and 45,000 contractor personnel.

FY 1995 Accomplishments

- Developed DOE Federal Employee Project/Program management courses.
- Developed and delivered training programs for over 3,000 Federal personnel at Headquarters and field offices to improve the technical capabilities of managers and staff.
- Acquired unique, high-tech industry training courses.
- Provided assistance to develop and deliver training programs for over 45,000 contractor personnel at Field offices.

FY 1996 Accomplishments (To Date and Planned)

- Develop DOE Federal Employee Project/Program training and conduct it at all DOE sites. New courses have been designed to improve how DOE manages its projects (using the lessons learned from the many studies initiated to better define the project definition phase, the cost and schedule controls, and project execution) and how we control our contractors.
- Develop and deliver training programs for over 3,000 personnel at Headquarters and Field offices that improve the technical capabilities of managers and staff who provide direction and oversight at defense nuclear facilities.
- Acquire unique, high-tech industry training courses from external sources for use by EM to provide new skills needed to correct performance deficiencies.
- Provide assistance to develop and deliver training programs for over 45,000 contractor personnel at Field offices that will improve the technical capabilities of managers and staff who operate, maintain, and provide staff support at defense nuclear facilities.
- Perform analysis and development of alternative training delivery systems in order to reduce the costs associated with the classical methods of training such as travel, per diem, and instructor costs; includes self-paced instruction, computer-based instruction, and interactive video delivery.
- Assist and support selected colleges and universities in the vicinity of DOE facilities to establish and maintain two-year accredited associate degree technician programs related to the clean-up of DOE facilities. This is designed to support the worker retraining programs, as well as upgrade the technical capabilities of the DOE Federal and contractor work force.

2602

III. Performance Summary (continued)

FY 1997 Planned Accomplishments

• Continue the development of EM Project Management Training, Program Management Training, and other courses in the integrated Environmental Manager's Training Program, as outlined by the EM Quality Improvement Team, incorporating the latest guidelines and lessons learned; validate that Program and Project Management has improved	$ 1,360
• Reduce the costs of Management and Operating Contractor technical training and provide services to EM Operations Offices in streamlining required training	310
• Create an annual training plan to identify and establish the process for the current fiscal year training and management execution	195
• Implement, within EM, the Department's qualification commitments, contained in its Implementation Plan for Defense Nuclear Facility Safety Board Recommendation 93-3, for upgrading Federal Employee and manager technical competence	1,250
• Develop/modify and deliver technical training curricula and related materials in support of the Technical Qualifications Program, Technical Short Courses and EM specific mission needs, including self-study materials, on-the-job training, etc	5,115
• Identify courses for conversion, conduct media analysis, convert courses, and conduct pilot training sessions	370
Total, FY 1997 Training and Education	$ 8,600

2603

CONTRACTUAL SERVICES

Provides other contractual services for the EM Headquarters mission.

FY 1995 Accomplishments

- Produced the Baseline Environmental Management Report and provided general analytic and production support to the development of international waste management policy; including bilateral agreements on improving Environmental Management, the Trilateral Task Force on Arctic Contamination, and development of the International Radioactive Waste Management Treaty (Office of Strategic Planning and Analysis).
- Provided for EM-wide information management infrastructure activities.
- Provided editorial, technical, administrative, logistical, and analytical assistance for the EM program's financial/planning/tracking systems (Office of Budget).
- Evaluated EM management and productivity/efficiency performance and progress (Office of Engineering and Cost Management).
- Provided other contractual support for the Massie Chair of Excellence, and EM-1 through EM-12.

FY 1996 Accomplishments (To Date and Planned)

- Produce the Baseline Environmental Management Report and provide general analytic and production support to development of international waste management policy (Office of Strategic Planning and Analysis).
- Provide for EM-wide information management infrastructure activities.
- Provide editorial, technical, administrative, logistical and analytical assistance for the EM program's financial/planning/tracking systems (Office of Budget).
- Evaluate EM management and productivity/efficiency performance and progress (Office of Engineering and Cost Management).
- Provide other contractual services for the Massie Chair of Excellence, and EM-1 through EM-12.

III. Performance Summary (continued)

FY 1997 Planned Accomplishments

• Produce the Baseline Environmental Management Report and provide general analytic and production support to development of international waste management policy (Office of Strategic Planning and Analysis)	$ 7,000
• Provide for EM-wide information management infrastructure activities, maintenance of the Local Area Network, the Wide Area Network, video teleconferencing, the World-Wide Web, program management and control, and Internet. Also provides for hardware, software, maintenance, and upgrades	10,000
• Provide editorial, technical, administrative, logistical, and analytical assistance in the development and implementation of those processes and systems associated with the design, development, implementation, and administration of the EM program's financial/planning/tracking systems. This includes business process analysis, financial analysis, research, studies, documentation, and related public participation activities (Office of Budget)	900
• Develop EM-wide performance objectives and criteria for the conduct of EM Headquarters operations and for evaluating management and productivity/efficiency performance and progress (Office of Engineering and Cost Management)	1,000
• Provide other contractual services for the Massie Chair of Excellence, and EM-1 through EM-12	$ 5,769
Total, FY 1997 Contractual Services	$24,669

SAFETY AND HEALTH

The Office of Safety and Health ensures that programs and projects managed by the Assistant Secretary for Environmental Management are conducted with adequate protection of the safety and health of workers and the public.

FY 1995 Accomplishments

- Developed technical standards which guide the development and review of Health and Safety Plans.
- Administered the Secretarial Officer's Working Group for Safety Analysis Report coordination and review.
- Provided technical support for the development of Standards/Requirements Identification Documents.
- Developed and implemented the EM Safety and Health Performance Indexing Pilot Program.
- Produced the Workplace Safety Improvement Program to raise safety and health visibility to senior management, and to provide incentives for exemplary safety and health behavior, as well as consequences for poor behavior.
- Developed the EM Occupational Safety and Health Desk Reference.
- Provided technical support in the areas of fire protection, criticality safety, nuclear safety, radiation protection, occupational safety, and industrial hygiene to resolve EM program issues.
- Developed metrics for safety and health performance measurement and compiled supporting data.
- Prepared, printed, and distributed the Manager's Guide for S&H Walkthroughs.
- Supported the development of the "Necessary and Sufficient" Closure Process and initiated five pilots to validate the process which will allow transition to standards-based management.
- Made significant progress in meeting DNFSB Recommendation 90-2 commitments by issuing Standards/Requirements Program guidance and facilitating field implementation.
- Characterized the status of criticality safety programs complex-wide.

FY 1996 Accomplishments (To Date and Planned):

- Facilitate implementation of "Necessary and Sufficient" at EM sites.
- Develop an integrated line approach to implementing safety and health policy.
- Address urgent risk issues associated with Hanford Tank Farms and Rocky Flats authorization basis.
- Develop a Safety and Health Framework for EM.
- Develop and implement an operating protocol for line, field, and safety and health organizations.
- Provide line with analysis of safety and health resource expenditures by M&O contractors.
- Develop EM-wide Safety and Health Critical Few Performance Measures.
- Collect, summarize and report occurrence report data, identify adverse trends and recommend corrective actions.
- Proactively identify potential field safety issues, inform line, make recommendations, provide technical assistance.

2606

III. Performance Summary (continued)

FY 1997 Planned Accomplishments:

• Continue integration of safety and health function into HQ line organizations by implementation of roles and responsibilities and safety and health framework	$ 1,000
• Identify, interpret, provide guidance and technical support for urgent safety and health issues	1,500
• Continue facilitation of "Necessary and Sufficient" and authorization basis initiatives	800
• Integrate safety and health performance measures into line management planning and awards/penalties process	1,086
TOTAL, FY 1997 Office of Safety and Health	$ 4,386

2607

Explanation of Changes FY 1996 to FY 1997:

Increase of $14,000,000 in the Education and Training, Stakeholder Affairs, and Strategic Planning activities due to the inclusion of other services previously funded within the programs.

Increase of $3,000,000 in the Information Resources Management activity to the fund consolidation (including infrastructure upgrades) of EM offices into the Germantown building in FY 1997.

Increase of $1,000,000 in the Cost and Performance Analysis activity to support GPRA performance measurement, bench marking, and baselining.

Increase of $2,500,000 in the Safety and Health activity to resolve safety and health issues affecting worker and public safety.

ENVIRONMENTAL MANAGEMENT SCIENCE PROGRAM

PROGRAM MISSION

"There is growing evidence of a brewing R&D crisis in the United States--the result of the cutbacks and refocusing in private-sector R&D and reductions in Federal R&D...The system suffers from a lack of consistent attention to longer-term needs and problems, a shrinking population of scientists and engineers available to perform high-quality R&D, and a loss of incentives and opportunities for a new generation of technologists." (C&E News, June 26, 1995, p. 24)

The need to build a stronger scientific basis for the Environmental Management effort has been established in a number of recent studies and reports. Among the important observations and recommendations made by the Galvin Commission ("Alternative Futures for the Department of Energy National Laboratories", February 1995) are the following:

> "Probably the most important reason behind the slow pace of assessment and cleanup [of DOE waste sites] is the low quality of science and technology that is being applied in the field...There is a lack of realization that many--and some experts believe most--existing remediation approaches are doomed to technical failure. Others would require unacceptable expenditures and much extended time to reach their stated objectives...There is a particular need for long-term, basic research in disciplines related to environmental cleanup...Adopting a science-based approach that includes supporting development of technologies and expertise...could lead to both reduced cleanup costs and smaller environmental impacts at existing sites and to the development of a scientific foundation for advances in environmental technologies."

In response to the Galvin Commission Report, as well as other recent recommendations, the Office of Environmental Management (EM) has established a Basic Science Program. The mission of this program is to:

- Develop and implement a targeted long-term basic research agenda for environmental problems so that "transformational" or breakthrough approaches will lead to significantly long-term reduced cleanup costs and risks to workers and public;
- "Bridge the gap" between broad fundamental research that has wide-ranging applicability such as that performed in DOE's Office of Energy Research, and needs-driven applied technology development that is conducted in EM's Office of Technology Development;
- Serve as a stimulus for focusing the nation's science infrastructure on critical national environmental management problems.

The Basic Science Program has been competitive and offered to the DOE national laboratories, as well as academic and industrial organizations. To ensure that the program is mission-oriented and that its achievements are recognized and used by EM, the Basic Science Program is closely integrated with EM's Technology Development Focus Areas and is also closely coordinated with the Office of Energy Research to ensure use of the broad-based fundamental research and development supported by that office.

2611

PROGRAM MISSION - ENVIRONMENTAL MANAGEMENT SCIENCE PROGRAM (cont'd)

Planning for the Basic Science Program began in 1995. The program responds to a congressional mandate stated in the conference report on the FY 1996 Energy and Water Appropriations Act, to focus on long-term, basic science research as the key to developing innovative and cost-effective cleanup methods. The decision to create the program also follows through on recommendations from stakeholders groups, including environmental experts from the National Academy of Sciences and the Secretary of Energy Advisory Board (SEAB). The program was originally developed by a team that includes representatives from EM and Energy Research, with advice from the DOE national laboratories. The following activities have taken place in FY 1995 and will take place during FY 1996:

- EM, Energy Research, and Laboratory team recommends science areas for FY 1996;
- Develop program plan in collaboration with the Office of Energy Research;
- Establish peer review procedure for selecting FY 1996 and FY 1997 EM science areas;
- Establish EM Science Advisory Board as a standing committee under the existing EM Advisory Board;
- Continue to involve the National Academy of Sciences for programmatic review;
- Issue call for proposals for FY 1996 and FY 1997 work in each primary science area;
- Convene peer review panels to review and select proposals to be funded in FY 1996 and FY 1997.
- Work with stakeholders to obtain input for developing site-specific research agendas.

The following primary science areas were included in the February 1996 call for applications.

- Advanced methods to accelerate treatment and immobilization of high-level wastes;
- New methods to characterize the hazards of landfills and liquid wastes;
- Emission-free destruction of organic wastes;
- Bioremediation;
- New concepts for waste stabilization of spent nuclear fuel; and
- Ecosystem restoration and management.

The following problem areas have been initially identified as problems in the EM Focus Areas where mission-oriented fundamental research is needed.

- Advanced characterization concepts that accelerate treatment and immobilization of high-level wastes. Pretreatment and separation concepts that lead to significantly less immobilized high-level waste requiring long-term isolation. Innovative separations for solids and for liquids, needed to significantly reduce projected high-level waste volume.

- In situ characterization of dense non-aqueous phase liquid to allow comparative risk assessments of alternative treatment methods. In situ immobilization of subsurface contaminants, improved immobilization of long-lived contaminants can effect pump and treat costs. Permeable in situ treatment barriers and factors governing in situ treatment processes; generally unsatisfactory alternatives exist for treatment of large plumes. Degradation and extraction methods for radioactive and hazardous contaminants from soil and water.

PROGRAM MISSION - ENVIRONMENTAL MANAGEMENT SCIENCE PROGRAM (cont'd)

- Characterization of heterogeneous wastes is needed to optimize decontamination and decommissioning recycling alternatives. Surface stabilization and fixation concepts are needed to reduce the ultimate waste volume and to enhance recycling. Selective and non-selective removal of contaminants from surfaces or bulk materials. Recycling of valuable commodities into general commerce.

- Non-destructive and in situ characterization methods to characterize the hazard of landfills. Innovative immobilization and transformation concepts that significantly reduce the cost of remediation. Ex situ separation and treatment concepts to rapidly and safely destroy or immobilize landfill constituents.

- Emission-free destruction of organic mixed wastes. Off-gas treatment that eliminates emissions in the environment exceeding Environmental Protection Agency requirements. Non-thermal treatment concepts for mixed waste.

- Plutonium behavior in mixed matrices. Long-term monitoring concepts for plutonium.

- New concepts for waste stabilization of spent nuclear fuel. Long-term monitoring and performance assessment of nuclear fuel. Physics and chemistry for radionuclides in mixed matrices.

- Specialized nuclear waste forms. Performance assessment concepts for nuclear waste disposal.

Also included in the EM Science Program Decision Unit is the Risk Policy Program. The goal of this program is to conduct and integrate risk management and analysis activities into the EM decision making process. The objective of this program is to provide the information necessary to allow credible, risk-based decision-making for the EM program.

PERFORMANCE MEASURES

This program is expected to result in significant cost savings over its lifetime, contribute to a more rational and defensible DOE cleanup program, and enhance technology exports from the knowledge gained. As the program continues to be developed, detailed performance measures will be established to measure those results.

ENVIRONMENTAL MANAGEMENT SCIENCE PROGRAM

BASIC SCIENCE PROGRAM

I. Mission Supporting Goals and Objectives

Planning for the Basic Science Program began in 1995. Utilizing a $50,000,000 Congressional add to the FY 1996 appropriation, a competitive process has been initiated and offered to the DOE national laboratories, academic and industrial organizations. Peer review panels will be convened to review and select proposals and selected fundamental research projects will be initiated. The FY 1997 funding will provide for formal review of research projects begun in FY 1996 and for another competitive process.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Basic Science Program	$ 0	$50,000	$38,137	$-11,863	-24%
TOTAL, Basic Science Program	$ 0	$50,000	$38,137	$-11,863	-24%

III. Performance Summary

FY 1995 Accomplishments:

- Conducted planning activities.

III. Performance Summary - Basic Science Program (cont'd)

FY 1996 Accomplishments (To Date and Planned):

- Environmental Management (EM), Department of Energy (DOE), Office of Energy Research and Laboratory team recommends science areas.
- Develop program plan in collaboration with the DOE Office of Energy Research.
- Establish peer review procedure for selection of basic science areas.
- Establish EM Science Advisory Board as a standing committee under the existing EM Advisory Board.
- Validate Science Advisory Board program plan and procedures.
- Issue call for proposals for work in each primary science area.
- Convene peer review panels to review and select proposals to be funded.
- Work with stakeholders to obtain input for developing site-specific scientific research agendas.

FY 1997 Planned Accomplishments:

• Reaffirm scope and direction of basic research needs for the program	$ 300
• Issue call for proposals for work in each primary science area	37
• Commence peer review panels to review and select proposals to be funded	300
• Begin mission-oriented fundamental research projects selected in FY 1996 and FY 1997	37,000
• Conduct formal review of first year's activities	500
TOTAL, BASIC SCIENCE PROGRAM	$38,137

Explanation of Funding Changes FY 1996 to FY 1997

- Fewer fundamental R&D proposals will be solicited from the DOE national laboratories, academia and the private sector.

Major Issues

- None

RISK POLICY PROGRAM

I. Mission Supporting Goals and Objectives

The goal of the Risk Policy Program is to provide credible risk based decision-making for the Environmental Management Program. This will be accomplished by developing risk policy and risk assessment and management practices, with meaningful stakeholder involvement, which provide for protection of human health and the environment. It includes developing the policy, guidance, and tools for credible processes for risk management.

Environmental management supported a risk framework in 1995 by awarding a series of risk initiative grants and cooperative agreements under a Notice of Program Interest published in the Federal Register. These cooperative agreements are with independent institutions to work together to help the Department further define and implement approaches to credible risk assessment, management, and communication practices. These include: the development of comprehensive, innovative methods to assess and communicate human health and environmental risk; research programs to develop a greater understanding of the human health and environmental effects associated with remediation activities at specific sites; and the development of information for human health and ecological risk analysis. These grants were long-term efforts with the majority of the work being conducted in FY 1996, FY 1997, and beyond.

In June of 1995, Environmental Management issued a congressionally mandated risk report. This report, "Risks and the Risk Debate: Searching for Common Ground, The First Step," provided an analysis of current and proposed risk management activities initiated to reduce risk and fulfill compliance requirements.

This report provided the first link between budget, compliance requirements and risk reduction activities. The Department of Energy field program managers with expertise about activities categorized the environmental management work. This allowed the Department to capture the spectrum of risks associated with environmental management activities and linked the risks in a qualitative fashion to compliance requirement and budget.

The Environmental Management Advisory Board endorsed the process used to collect the information and recommended that it be improved and directly tied to the budget process. This is a major initiative of the Environmental Management program in FY 1996 for the FY 1998 budget.

II. Funding Schedule - Risk Policy Program (cont'd)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Risk Policy Program	$23,650	$13,875	$13,999	$ + 124	0%
TOTAL, Risk Policy Program	$23,650	$13,875	$13,999	$ + 124	0%

III. Performance Summary

FY 1995 Accomplishments:

The primary areas that the Risk Policy Program concentrated on in FY 1995 were:

- Promoted mechanisms for integrating risk information into the process for establishing priorities among competing EM requirements -- Facilitating the use of risk in the budget process, one of the recommendations from the Environmental Management Advisory Board (EMAB).
- Support risk initiative Grants and Cooperative Agreements with independent institutions who will work together to help the Department further define and implement approaches to credible risk assessment, management, and communication.
- Develop policy, requirements, and guidance for implementing credible and dependable risk assessment and risk management practices.
- Ensure that risk-related information is accessible and provide in a useful form to the public.
- Issued Principles for Using Risk Analysis, a first cut at defining risk analysis, its purposes, and the principles to be followed if it is to be done well and credibly.
- Awarded Grants and Cooperative Agreements to independent institutions who will work to further define and implement credible approaches for risk assessment, management, and communication.
- Developed an approach to capturing the spectrum of risks associated with diverse EM activities, which qualitatively linked risks to compliance requirements and the budget.
- Issued the Draft Risk Report to Congress, a first step toward developing a consistent approach to evaluating the risks to the public, workers, and the environment posed by conditions at DOE's sites and facilities.

III. Performance Summary - Risk Policy Program (cont'd)

FY 1996 Accomplishments (To Date and Planned):

- Support Risk Initiative Grants and Cooperative Agreements, awarded in 1995 under a Notice of Program Interest published in the Federal Register. These agreements are with independent institutions who work together to help the Department further define and implement approaches to credible risk assessment, management, and communication.
- Provide technical support to develop EM-wide guidance tools for implementing a credible framework for EMs risk analysis, risk management, risk communications, and priority setting initiatives.
- Provide technical peer review and comments on scientific and technical risk materials, both internally and externally, through nationally recognized scientific and technical organization.
- Integrate risk information into the process for establishing priorities among competing EM requirements, facilitating the use of risk in the FY 1998 budget, a major EMAB recommendation.
- Work with peer review groups to ensure that risk information collected for the FY 1998 budget process is consistent and credible, and to improve the quality of the FY 1999 process.
- Provide expanded access for internal and external stakeholder to useful risk-related information.
- Integrate the process of collecting risk information into data collection tools and guidance for the FY, 1999 budget process.

FY 1997 Planned Accomplishments

• Implement credible approaches to risk assessment, management, and communication as they are developed by Risk Cooperative Agreement partners. Support Risk Initiative Grants and Cooperative Agreements, awarded in 1995. This includes the development of comprehensive, innovative methods to assess and communicate ecological and human health risks; research programs to develop a greater understanding of the ecological and human health effects associated with remediation activities at specific sites; and the development of models related to ecological risk analysis	$10,000
• Work with peer review groups to ensure that risk information collected for the FY 1999 budget process is consistent and credible, and to improve the quality of the FY 2000 process. Address issues identified in the congressionally-mandated report on the health and safety risks to workers and the public associated with EM sites and activities. This includes continued support and further development of tools for qualitatively evaluating all EM sites and activities by headquarters and the field	2,500
• Continue to develop policy, requirements, and guidance for implementing credible and dependable risk assessment and risk management practices. Provide technical support to develop EM-wide guidance tools for implementing a credible framework for EM's risk analysis, risk management, risk communication, and priority setting initiatives, as outlined in the Department's "Principles for Using Risk Analysis" and in the National Academy of Sciences Reports "Building Consensus" and "Improving the Environment"	1,499
TOTAL, FY 1997 RISK POLICY PROGRAM	$13,999

PRIVATIZATION

I. Mission Supporting Goals and Objectives

The Office of Environmental Management (EM) has experimented with a number of forms of privatization and several have been highly successful in reducing costs. The successful projects (listed below) involve the purchase of waste management services at a fixed price by EM. They rely on a contractor to design, permit, finance, construct, and operate the necessary facility. The contractor is then paid for providing waste management services meeting the Department's performance specifications. Environmental Management will obligate the appropriated funds as privatized facilities are built. Budget outlays will not occur until the completed facilities are operational and providing the service required. Typically, outlays will occur three to four years after a contract award. This budget describes the privatization effort for treatment of waste in tanks at Richland, Washington.

Other privatization projects are planned throughout the EM Program. Such projects may be added to this budget account in future years so that they may be tracked accordingly. An additional $182,000,000 for EM Privatization Projects is being requested in the President's FY 1997 Budget Submission as part of the General Provisions. This request is part of an ongoing effort to improve planning and budgeting for acquisition of fixed assets and similar procurements.

PRIVATIZATION - HANFORD TANK WASTE (cont'd)

I. Mission Supporting Goals and Objectives - (cont'd)

Examples of Environmental Management Privatization Projects

SITE	PROJECT NAME	ESTIMATED COST	PRIVATIZATION COST	SAVINGS
Hanford	Laundry Facility	$100M	$40M	$ 60M a/
Hanford	Low Level Mixed Waste Thermal Treatment Fac.	$610M	$40M	$570M
Idaho	Alpha Mixed Waste Treatment Fac.	$470M	$184M	$286M
Idaho	Laundry Facility	$ 6M	$ 1M	$ 5M a/
Idaho	Pit 9 Remediation	$313M b/	$179M c/	$134M
Savannah River	M-Area Mixed Waste Tank Remediation	$ 46M	$ 18M	$ 28M

2626

a/ Estimated savings based on assumed a 10 year operation.
b/ DOE Idaho independent cost estimate, including contingency.
c/ Private cost estimate assumes follow-on work.

I. Mission Supporting Goals and Objectives - (cont'd)

Hanford Tank Waste Treatment:

As part of the Reinventing Government and Contract Reform Initiatives, the Department of Energy (DOE) staff have evaluated the feasibility of privatizing all or part of the Hanford Tank Waste Remediation System (TWRS). The effort is also a follow-up to the DOE evaluation of a privatization concept offered by the Environmental Corporation of America for using its own funding to build a plant at Hanford to vitrify the high-level fraction of the tank waste. Privatization in the context used for the evaluation was understood to mean payment for services performed in delivery of waste treated to performance specifications.

As part of the overall evaluation, substantial information was collected or synthesized for use in determining feasibility. It was determined that a two Phase approach to TWRS privatization was desirable, both from an economic standpoint and from the point of view of private vendors. The first of the two phases would be a commercial demonstration phase where private vendors would treat sufficient waste to demonstrate to both DOE and to the financial community that they, the private vendors, were capable of treating the remainder of the tank waste in a larger, second phase effort.

Phase 1 would last from 1996 through 2007 or longer with options if the facilities are cost effective. Two vendors would be selected to treat between 6 to 13 percent of the tank waste. The scope of Phase 1 would involve (for each successful vendor):

- Sequential retrieval/transfer by DOE of waste (in batches, not mixed) from selected tanks to two existing tanks designated as feed tanks (one assigned to each vendor).
- Vendor retrieval/transfer of waste from its feed tank to vendor's facility.
- Vendor pretreatment to separate tank waste into low- and high-activity waste fractions and immobilize the low- and high-activity waste fractions; or as an option, provide integrated treatment of tank waste resulting in one high-activity waste stream for immobilization.
- Vendor deactivation of all vendor-supplied facilities and equipment.
- Vendor would own facility on leased DOE land in the 200 area of the Hanford Site.

Phase I would be divided into 2 stages: Design, Permitting and Construction/Operation -- three contractors would be awarded fixed price contracts from competitive proposals based on technical proposals and target prices bid for treated waste. Following sufficient design activities resulting in acceptable permit applications, one or more vendors would be terminated and paid a pre-negotiated price for their efforts. The remaining vendor(s) would be paid a pre-determined fixed payment based on a risk sharing agreement with DOE and the vendor(s) would continue with permitting, construction and operations. The Department would expect the vendor(s) to establish a pre-determined level of equity in the plant to provide assurance to both DOE and the financial community at the time of the Department's fixed payment. (DOE will not approve or buy the vendor technology or design)

2627

PRIVATIZATION - HANFORD TANK WASTE - (cont'd)

I. Mission Supporting Goals and Objectives - (cont'd)

- o In the Request for Proposals, DOE has provided bounding information on waste physical properties, chemistry, radionuclide content and volume, nuclear safety requirements and oversight process, treated waste form performance specifications, and a list of additional information or services DOE will furnish to successful vendors to include user charges that may be involved such as for utilities or other services.
- o Contractors would privately finance the design, permitting, and construction of the facilities; operate the facility; and ultimately be responsible for deactivation in accordance with applicable regulations.
- o A capital payment will be made to each contractor when they satisfactorily complete the design/permit submission process based on shared risk for the overall construction. The risk sharing formula requires two selected contractors to hold at least 20 percent of the fixed capital investment in their respective plants as vendor supplied capital. The Department will compensate the terminated contractor at pre-agreed to level.
- o The Department would hold contractors responsible for technical/cost performance and pay only for treated waste product meeting contract performance specifications (except for the fixed payment following the initial design period), once their plant begins operations.
- o Vendors would be subject to applicable TPA enforceable deadlines (existing or renegotiated) as incorporated in the contract.

II. Funding Schedule:

	FY 1995 Comparable	FY 1996 Original Appropriation	FY 1996 Real & Comp Adjustment	FY 1996 Comparable Appropriation	FY 1997 Budget Request
Termination Liability	$ 0	$ 0	$ 0	$ 0	$185,000
TOTAL	$ 0	$ 0	$ 0	$ 0	$185,000
Richland Operations Office	$ 0	$ 0	$ 0	$ 0	$185,000
TOTAL	$ 0	$ 0	$ 0	$ 0	$185,000

* Funds have been set aside from Waste Management's Appropriation in both FY 1995 and FY 1996 to be devoted to this new budget account. The Total Project Cost for Phase I is considered procurement sensitive due to the ongoing procurement.

2628

PRIVATIZATION - HANFORD TANK WASTE (cont'd)

II. Funding Schedule - (Cont'd)

Note that privatization projects are funded using expense funds only and that BA requested as a termination backstop would require reprogramming to the appropriate budget category in the event of termination of the contract. Outlays for this project are expected to begin not earlier than 2002.

III. Performance Summary

FY 1995 Accomplishments

- o Secretary accepts recommendations for feasibility for Privatization and approves implementation.

FY 1996 Accomplishments (To Date and Planned)

- o Draft Request for Proposals issued November 1995. Final request issued February 1996.
- o Contract(s) are planned to be awarded by August 1996.

FY 1997 Planned Accomplishments

- o Successful vendors conduct design and permitting activities.

2629

SITE OPERATIONS - DEFENSE

PROGRAM MISSION

The Office of Site Operations' mission is to serve as an advocate and provide policy direction for landlord planning and budgeting, including reducing site infrastructure costs and managing workforce restructuring for Environmental Management (EM), and for all activities at Mound and Pinellas. The Office will serve as the focal point for the Department of Energy (DOE) wide programs for transportation management, emergency management, characterization management, pollution prevention, and waste minimization. The Office will also operate as the Headquarters champion in the EM Program for the Operations Offices and field sites by providing leadership for crosscutting issues and topics raised by the field or EM Headquarters review, concurrence, resolution, or other decisions are acted upon quickly, corporately, and equitable.

Through its landlord program and other activities, the Office of Site Operations will gather data on the total site support costs. On average, these "balance of site costs" represent approximately 50 percent of a site's budget. Therefore, the Office will analyze these site support costs and develop and implement benchmarks for use in reducing these "balance of site costs."

The realignment of the Mound and Pinellas Offices into Site Operations signifies that efficient site closure will require an integrated EM-wide effort. The integrated, systematic approach developed here will serve as a model for the eventual shutdown and ultimate disposal of the remaining former Defense Programs (DP) sites and other DOE sites.

By focusing national attention to several programs that have impact across the DOE complex, the Office of Site Operations will be responsive to the General Accounting Office (GAO) and others who have pushed for national focus for EM programs. Characterization Management, Transportation, and Pollution Prevention are programs having nation-wide goals and benefits that will be enhanced by being managed by a program office created to respond to issues and needs that have impact across the DOE complex. The Office of Site Operations will provide the national focus and was created in FY 1996 by combining national crosscutting program elements from other EM organizations. The consolidation of these crosscutting and national programs will allow the Office, using its relatively small budget, to influence much larger EM-wide and DOE-wide programs. Funding for FY 1996 remains in the original EM organizations, however, activities and accomplishments for FY 1995 and 1996 are shown for comparability purposes. Funding for the new organization is requested for the first time in FY 1997.

SITE OPERATIONS - DEFENSE - PROGRAM MISSION

The GOALS of the Office of Site Operations Program are to:

- o Optimize EM landlord programs to provide safe, reliable, and efficient infrastructure and site services, while reducing support costs and maintaining regulatory compliance.
- o Integrate all EM program activities at Mound and Pinellas to manage and expedite closeout and disposition, creating a model for other DOE sites. Pinellas will be closed out by September 1997 and vacated by mid-1998.
- o Assure, on behalf of the Department, the safe, secure, economical, and regulatory-compliant packaging and transportation of DOE materials, including hazardous and radioactive materials and waste, and spent nuclear fuel.
- o Provide policy, training, and planning and technical assistance to assure safe and efficient Federal, tribal, state, and local response to emergencies involving DOE unclassified radioactive material.
- o Advance EM environmental characterization activities, including analytical services, to a superior level of efficiency, productivity, accountability, and rigor.
- o Assure the Department is highly successful in achieving ambitious goals for pollution prevention and waste minimization, including reduction in generation of hazardous, radioactive, mixed, and sanitary wastes, and promotion of significant cost savings and efficiency improvements through recycling.
- o Continuously improve EM program effectiveness by assuring consistent Headquarters direction to the field across EM programs, and to assist Headquarters and the field in identifying, negotiating, and resolving crosscutting EM issues.

The OBJECTIVES related to these goals are to:

- o Identify and establish benchmarks for EM-wide activities.
- o Develop integrated EM-wide positions on proposed legislation and regulations, and assist the Administration in promoting responsible laws.
- o Act as the EM National Environmental Policy Act (NEPA) Compliance Officer.
- o Improve inter-agency communication to clarify and streamline the regulatory process.
- o Issue guidance for restructured EM approval of cleanup and compliance agreements.
- o Provide technical assistance to enhance the effectiveness of the Department's transportation and packaging operations.
- o Provide clear and consistent transportation operations and traffic management policy, direction, and guidance, aimed at achieving excellence in operations by ensuring consistent interpretation of external regulations, Departmental policies, and guidance.
- o Provide a single point for communication between Headquarters and each site on transportation operations and traffic management issues that crosscut DOE organizations (excluding weapons and weapons components).
- o Develop a program plan to achieve the Department's pollution prevention goals and manage the field's site-wide pollution prevention programs to more effectively achieve these goals.

2631

SITE OPERATIONS - DEFENSE - PROGRAM MISSION

PERFORMANCE MEASURES:

- o Develop "Balance of Site Benchmark."
- o Number (seven) of pollution prevention projects implemented and costs saved or avoided by these projects (number of projects; and costs savings or avoidances).
- o The volume (for radioactive waste) or weight of (for non-radioactive waste) generated and reduced for mixed waste, radioactive waste (broken out by type: high-level, low-level, and transuranic), hazardous waste, and sanitary wastes (cubic meters, m^3,; kilograms, kg)
- o The weight of toxic chemicals released and transferred off-site (kilograms, kg).
- o Complete DOE exit from the Pinellas site by the end of FY 1997, except for residual administrative activities and long-term groundwater pump-and-treat operations.
- o Land and buildings releasable for disposition (percentage of total acres) (Mound).
- o Groundwater pump and treat (micrograms per liter) (Mound).
- o Contaminated excess nuclear materials, and nuclear and hazardous waste, removed (thousands of cubic feet) (Mound)
- o Potential Release (contamination) Sites resolved (number of sites) (Mound).

SITE INTEGRATION - DEFENSE

(Tabular dollars in thousands, narrative in whole dollars)

I. Mission Supporting Goals and Objectives

The Office of Site Integration's budget focuses on activities related to the management of general purpose infrastructure (i.e., "balance of site") and site-wide support services that are essential for owning, operating, and accomplishing essential missions at DOE Environmental Management sites.

The Defense Environmental Restoration and Waste Management appropriation funds the infrastructure and site support services collectively as landlord program activities at the following sites: Savannah River, Idaho, and Richland. Specific examples of infrastructure and support systems include: grounds, roads, general purpose buildings, utilities, communications, computers and information, fleet management, maintenance and fabrication, emergency services, land management, analytical laboratories, and environmental test facilities.

The landlord program provides infrastructure and site support through line-item and expense-funded projects, state environmental and monitoring grants, downwinder litigation, payments-in-lieu-of-taxes, document declassification, radiation test documentation, and health information.

The goal of the Site Integration landlord program is to ensure that the general purpose infrastructure and site services are always ready to safely, reliably, and efficiently support environmental management activities in a cost effective manner.

The end-state goal for the Office of Site Integration program area is the implementation of the minimum set of landlord support functions. Surplus facilities or equipment will be either recycled for interim or indefinite alternative uses by DOE, transferred for reuse to another government agency, excessed to the General Services Administration (GSA), transferred to Environmental Restoration for remediation, or demolished. Once established, the end-state will minimize DOE overhead costs and, in some cases, avoid unnecessary capital costs.

In FY 1997 the Site Integration budget reflects a scope of work which is, in part, funded by uncosted balances from prior years.

2637

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Landlord	$ 238,046	$ 188,903	$ 130,336	-58,567	-31%
TOTAL, Site Integration	$ 238,046	$ 188,903	$ 130,336	-58,567	-31%

III. Performance Summary

FY 1995 Accomplishments:

- o Provided site-wide landlord services for 9 major facilities associated with the Idaho National Engineering Laboratory (INEL). (ID)
- o Acquired capital equipment that is required to maintain operations for 14 site-wide service programs supporting the INEL. (ID)
- o Completed the construction of the INEL Transportation Complex (92-D-183), INEL Sewer System Upgrade at the Central Facilities Area (CFA) (92-D-182), and initiated the construction of the INEL Electrical Upgrade (93-D-172), the Emergency Response Facility (94-D-401), and the Medical Facility at the CFA (94-D-415) to provide cost effective, life-safety and health improvements. (ID)
- o Completed General Plant Project (GPP) construction items to maintain a safe and cost efficient infrastructure, such as the Idaho Research Center (IRC) Chemical Storage Facility, the IRC Fume Hood Upgrade, the CFA Deep Well Upgrade, the CFA-623 Paint Process Room Addition, and the Test Reactor Area (TRA) Gas Bottle Storage Area. (ID)
- o Demolished 10 non-process contaminated surplus facilities (53,500 square feet). (RL)
- o Completed the corrective action plan associated with recent steam system accident. (RL)
- o Inspected and analyzed 2 million square feet of facilities and prioritized the remaining 4,460,000 square feet of facilities at the Hanford Site. (RL)
- o Provided grant funding to the States of Washington and Oregon for environmental management issues, emergency planning/preparedness, and waste transportation. (RL)
- o Operated the Hanford Filter Test Facility to test High Efficiency Particulate Air Filters. (RL)
- o Replaced 211,916 square feet of roof (Buildings 282EA, 318, 384, 190X, and two other smaller buildings). (RL)
- o Procured penetrometer necessary to support the Hanford Filter Test Facility. (RL)
- o Completed Phase I of the electrical distribution system upgrade (current system presented serious safety liabilities). (RL)
- o Established centralized management for fileservers and desktop computers. (RL)
- o Completed Automated Transportation Management System, which was later accepted as standard by 22 DOE sites and GSA. (RL)
- o Accepted End Point Criteria Software in sufficient time to support Plutonium-Uranium Extraction (PUREX) documentation as initial application. (RL)

III. Performance Summary (con't)

FY 1995 Accomplishments: (con't)

- o Closed inefficient and obsolete 284 west powerhouse. (RL)
- o Eliminated unnecessary bus services estimated to save $3,000,000 in FY 1996. (RL)
- o Reduced electrical energy costs from $5.6 to $5.3 cents per kilowatt hour (approximately $9,000,000 savings per year). (RL)
- o Reduced light vehicles by 15 percent. (RL)
- o Vacated facility to reduce occupancy costs by $9,000,000/year. (RL)
- o Reduced crane and rigging rates by 35 percent and 56 percent respectively. (RL)
- o Reduced Hanford inventory by 15,897 items (25.3 percent) with a cost savings of more than $7,800,000. (RL)
- o Approved definitive designs and awarded construction contracts for the Hazardous Materials Management and Emergency Response (HAMMER) Training Center at Hanford. (RL)
- o Completed 92-D-153, Engineering Support Facility. (SR)
- o Contracted out Contaminated/Non-Contaminated Laundry Services estimated to save $215,000 a year. (SR)
- o Contracted out A-E Engineering/Design Services to a "Corral" of four companies estimated to save $8,000,000 a year. (SR)
- o Manage forest and land resources on a 300 square mile site. (SR)
- o Conducted ecological studies at the Savannah River Ecology Laboratory (SREL). (SR)
- o Provided program support for engineering and project activities, training, budget, financial planning, and payment in lieu of taxes, as well as Historically Black Colleges and Universities, grants and general administrative services. (SR)
- o Acquired capital equipment that is required to maintain safe and efficient operations for site-wide programs such as Information Resources Management, Engineering and Construction Services, material management, administrative services, utilities, central services, and transportation. (SR)
- o Completed GPP construction items to maintain a safe and cost efficient infrastructure. (SR)
- o Continued activities for on-going construction projects and complete one construction project, which will allow the site to comply with state drinking water standards, the Clean Air Act, and to support the various program missions: the HP Instrument Calibration Facility (92-D-143); completed one construction project: 92-D-153, Engineering Support Facility. (SR)
- o Initiated construction of two projects at Savannah River to replace deteriorating bridges and to replace the radio system to comply with Federal regulations: Site Road Infrastructure and Radio Trunking System. (SR)

FY 1996 Accomplishments (To Date and Planned):

- o Provide site-wide landlord services for 9 major facilities associated with INEL. (ID)
- o Acquire capital equipment that is required to maintain safe and efficient operations for 14 site-wide service programs supporting INEL. (ID)
- o Complete the construction of the INEL Electrical Upgrade project (93-D-172), the TRA Sewer Treatment Plant as part of the Sewer System Upgrade (92-D-182), the Emergency Response Facility at CFA (94-D-401), and the Medical Facility at CFA (94-D-415), all of which support a cost effective, life-safety and health compliant infrastructure. (ID)
- o Complete GPP construction items to maintain a safe and cost efficient infrastructure, such as the CFA 690 Roof Replacement and the East Butte Radio Communications Upgrade. (ID)
- o Complete construction of the replacement facility for the 300-Area process sewer. (94-D-412) (RL)
- o Complete Building 324 renovation to meet safety requirements. (RL)

2639

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned): (con't)

- o Transition mainframe computer and data center to smaller, unmanned facility. (RL)
- o Contract out mail service and reduce other multi-media costs to save $2,600,000. (RL)
- o Implement metering/library system for all common software. (RL)
- o Develop and implement additional computer data systems to support deactivation end points. (RL)
- o Reengineer support services for vehicle maintenance, railroad, transportation, sanitary and disposal of non-radioactive hazardous wastes generated from daily site-supported services. (RL)
- o Shutdown balance of Hanford Central steam plants and replace with energy saving performance contract. (RL)
- o Complete Environmental Management mission in 300-Area and excess 72 acre property to GSA. (RL)
- o Lease 400 area to Port of Benton. (RL)
- o Continue reduction of an additional 300,000 square feet of Government owned space. (RL)
- o Complete Phase I construction of the HAMMER Training Center at Hanford and conduct training. (RL)
- o Continue depository of the Fitzner/Eberhardt and Lands Ecology Reserve. (RL)
- o Privatize D-Area Powerhouse estimated to save $15,000,000 a year. (SR)
- o Manage forest and land resources on a 300 square mile site. (SR)
- o Conduct ecological studies at the Savannah River Ecology Laboratory (SREL). (SR)
- o Provide program support for engineering and project activities, training, budget, financial planning, and payment in lieu of taxes, as well as Historically Black Colleges and Universities, grants and general administrative services. (SR)
- o Acquire capital equipment that is required to maintain safe and efficient operations for site-wide programs such as Information Resources Management, Engineering and Construction Services, material management, administrative services, utilities, central services, and transportation. (SR)
- o Complete GPP construction items to maintain a safe and cost efficient infrastructure. (SR)
- o Continue activities for on-going construction projects and complete two construction projects: 92-D-151, Operation Support Facilities and 93-D-152, Environmental Modification to Production Facilities. (SR)
- o Initiate construction of one project at Savannah River to replace chiller to support missions and comply with Clean Air Act: 96-D-471, CFC/HVAC Retrofit. (SR)

FY 1997 Planned Accomplishments:

- o Provide on-going site-wide landlord services for 9 major facilities on 560,000 acres, such as emergency preparedness, seismic and environmental monitoring, site planning, and flood research/mitigation. (ID) $10,988
- o Acquire capital equipment that is required to maintain safe and efficient operations for 14 site-wide service programs such as: the fire department, health physics, and Information Resources Management. (ID) 8,150

2640

III. Performance Summary (con't)

FY 1997 Planned Accomplishments: (con't)

o Continue activities for on-going construction projects and complete two construction projects, which will cost effectively improve the life-safety and health of site workers: the Fire Training Facility as part of the Emergency Response Facilities project (94-D-401), and the INEL Fire and Life Safety project (92-D-181). (ID)	1,340
o Initiate construction of one project at Idaho to replace deteriorating and insufficient infrastructure: Electrical Distribution Upgrade project (96-D-461). (ID)	6,862
o Complete GPP construction items to maintain a safe and cost efficient infrastructure, such as the replacement of 49,000 square feet of roofing on 3 facilities at Idaho. (ID)	4,807
o Provide required financial and program planning documents, such as Activity Data Sheets, Site Integration Planning, Process Tracking System/Site Management System input, and Multi-Year Program Plan; and submit site-wide inputs. (RL)	1,649
o Provide annual funding for the following: DOE grants for operation of the Hanford Oregon Waste Board, Washington State Department of Ecology's oversight and management of the Tri-Party Agreement, Hanford Filter Test Facility, Washington's emergency response capability and oversight of Hanford management practices, a multi-year Secretarial initiative to declassify 56,000 Hanford documents and documenting radiological doses received by residents near the Hanford site, educational information about the effects of exposure to the public and health officials through the Hanford Health Information Network (2,000,000), legal expenses associated with downwinder litigation, and payments in lieu of taxes to three Washington counties. (RL)	18,071
o Provide core infrastructure activities in order to support all Hanford environmental management programs. These activities include: replace 71,000 square feet of unsafe roofing on 15 buildings, demolish 9 general purpose buildings, replace or reline the 300 Area Process Sewer to ensure containment of waste, complete renovation of the 324 Facility (95-D-454) for compliance with Federal environmental and occupational safety and health requirements, maintain deteriorating roads and paved areas essential to site operations, upgrade emergency sirens for compliance, replace core sanitary sewer in 200 East area to comply with Tri-Party Agreement, replace deteriorated process water system in 325 building, and manage the general purpose infrastructure and site-support services of Hanford. (RL)	12,047
o Complete Phase II (final) construction and equipment outfitting of the HAMMER Training Center at Hanford and conduct training. (RL)	13,486
o Manage forest and land resources on a 300 square mile site; manage timber sales; document endangered wildlife and plantlife; perform water shed planning; control erosion; and, maintain secondary roads. (SR)	12,024
o Conduct ecological studies at the Savannah River Ecology Laboratory (SREL) (SR)	8,246
o Provide program support for engineering and project activities, training, budget, financial planning, and payment in lieu of taxes, as well as Historically Black Colleges and Universities, grants and general administrative services. (SR)	5,748
o Acquire capital equipment that is required to maintain safe and efficient operations for site-wide programs such as Information Resources Management, Engineering and Construction Services, material management, administrative services, utilities, central services, and transportation. (SR)	3,136
o Complete GPP construction items to maintain a safe and cost efficient infrastructure. (SR)	1,270

III. Performance Summary (con't)

FY 1997 Planned Accomplishments: (con't)

o Continue activities for on-going construction projects, which will allow the site to comply with state drinking water standards, the Clean Air Act, to support the various program missions: the HP Instrument Calibration Facility (92-D-143) and complete one construction project. (SR)	17,402
o Initiate construction of two projects at Savannah River to replace deteriorating and insufficient facility: HP Site Support Facility (96-D-423) and Environmental Monitoring Lab (96-D-470). (SR)	5,110
TOTAL, FY 1997 Site Integration	$130,336

Explanation of Funding Changes FY 1996 to FY 1997:

- o Decrease of $34,700,000 is due to pace of landlord facility replacements/upgrades at Richland and Savannah River.
- o Decrease of $7,000,000 is due to completion of Line Item Projects. (ID, RL)
  - Emergency Response Facility (94-D-401). (ID)
  - 324 Facility Compliance/Renovation (95-D-454). (RL)

Major Issues:

- o None

2642

MOUND & PINELLAS PROJECT OFFICE
(Tabular dollars in thousands, narrative in whole dollars)

I. Mission Supporting Goals and Objectives

The Pinellas Plant is a 97 acre site located in Pinellas County, Florida, about six miles from the City of St. Petersburg. The Pinellas Plant was an essential part of the Nation's defense nuclear weapons complex until production of weapons-related components was discontinued in September 1994. The plant manufactured neutron generators, miniaturized linear accelerators, and other high-technology nuclear components. In 1995, the Pinellas Plant was sold to the Pinellas County Industrial Council, and DOE leased back portions of the plant to complete final environmental remediation of the plant site which, except for a residual long-term groundwater pump-and-treat operation, is scheduled to be completed by the end of FY 1997. Activities at the Pinellas Plant are managed by the Albuquerque Operations Office. Legal drivers at Albuquerque include Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), Resource Conservation and Recovery Act (RCRA), National Environmental Policy Act (NEPA), DOE Orders, Florida State laws and codes and Agreements-in-Principle (AIP). The mission of the Pinellas Plant involves completion of safe shutdown of the Defense Programs activities, removal of tritium and tritium contaminated processing equipment, disposition of all personal property and records, termination of its management and operating contract, and completion of most environmental restoration activities by the end of FY 1997.

The Mound Plant site is located in Miamisburg, Ohio, and was built in the late 1940's to support research and development and production activities for the Department's weapons and energy programs. It occupies 306 acres of land in southwestern Ohio. Weapons production support ended in 1994, when activities across the country were consolidated at the Kansas City Plant (KCP) in Missouri, Los Alamos, and Savannah River. Mound is currently processing tritium units for Defense Programs (DP) through CY 1997. These manufacturing and processing operations resulted in the contamination of soils and ground water with radioactive and hazardous chemicals. Mound has been placed on the National Priority List (NPL), and a Federal Facility Agreement (FFA) for accomplishing the remediation of Mound has been negotiated with the Environmental Protection Agency (EPA) and the State of Ohio. Activities at the Mound Plant are managed by the Miamisburg Area Office. The mission of the Mound Plant involves the transition from an active production plant to a total safe shutdown and cleanup of the facilities and soil, and sale of the property. This mission includes responsibility for operation of the plant infrastructure, disposition of nuclear materials, facility surveillance and maintenance, and remediation and title transfer of property.

The Nuclear Material and Facility Stabilization program assumed management of both the Pinellas and Mound Plants from DP on August 1, 1995, and assigned overall programmatic responsibilities to the Mound and Pinellas Project Office, which was realigned under the Office of Site Operations in December 1995. The Mound and Pinellas Project Office assumes a leadership role to ensure that DOE exits these sites in a safe, rapid, and cost effective manner which is responsive to community and other stakeholder concerns.

2643

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Pinellas Activities:					
CERCLA	$ 599	$ 900	$ 690	$ -210	-23%
Facility Operations & Site Deactivation	38,095	3,269	3,664	+395	+12%
Landlord	0	25,811	27,613	+1,802	+7%
RCRA Materials	4,523	22,510	27,098	+4,588	+20%
TOTAL, Pinellas Activities	$ 43,217	$ 52,490	$ 59,065	$ +6,575	+13%
Mound Activities:					
CERCLA	$ 28,812	$ 89,078	$ 75,354	$ -13,724	-15%
Facility Operations & Site Deactivation	53,524	1,000	4,100	+3,100	+310%
RCRA Materials	11,145	8,063	6,788	-1,275	-16%
TOTAL, Mound Activities	$ 93,481	$ 98,141	$ 86,242	$ -11,899	-12%
TOTAL, Mound & Pinellas Project	$ 136,698	$ 150,631	$145,307	$ -5,324	-4%

III. Performance Summary

FY 1995 Accomplishments:

- o Successfully concluded the Nevada Operations (NVO) audit and began to ship low-level waste (LLW) from Pinellas to the Nevada Test Site (NTS) for disposal.
- o Provided for Potentially Responsible Party (PRP) contributions as required of Pinellas (Peal Oil).
- o Continued ground water remediation at the 4.5 Acre Site. (Pinellas)
- o Continued construction of final corrective measures for Pinellas Miscellaneous Sites (three sites).
- o Provided for public participation activities to ensure public acceptance of cleanup activities and decisions. (Pinellas)
- o Initiated interim measures at the West Fenceline. (Pinellas)
- o Initiated Northeast Site and Building 100/Old Drum Storage Area corrective measures construction. (Pinellas)
- o Provided for AIP support to Florida. (Pinellas)

III. Performance Summary (con't)

FY 1995 Accomplishments: (con't)

- o Performed scoping activities in preparation for transfer of the Mound and Pinellas Plants from DP to EM.
- o Accepted management responsibilities for Mound and Pinellas due to mission change from defense-related activities to Environmental Management activities.
- o Sold the Pinellas Plant to the Pinellas County Industry Council with planned completion of DOE mission in FY 1997.
- o Transferred management of the Mound Facility from Albuquerque to Ohio.
- o Resumed LLW soil shipments from Mound to the Nevada Test Site (NTS), 50,000 cubic feet since August 1994, with completion August 1995.
- o Began shipping LLW to Envirocare in Utah in July 1995, based on an exception granted in April 1995. (Mound)
- o Successfully completed the development/progress of mixed waste treatment technology, Packed Bed Reactor, Bio-Degradation, and Tritium Capture System. (Mound)
- o Completed dismantlement of Special Metallurgical (SM) building and breezeway. (Mound)
- o Completed limited decontamination of SM stack. (Mound)
- o Completed soil removal from SM Leach Field Catch Basin. (Mound)
- o Initiated removal from SM North Grass Area. (Mound)
- o Completed Fire Fighting Training Area Removal action. (Mound)
- o Completed Area 7 tank removal. (Mound)
- o Completed design for Operable Unit 4 (OU4) removal. (Mound)
- o Completed Record of Decision (ROD) for OU1. (Mound)
- o Made 10 percent of Mound releasable for sale or lease under CERCLA.
- o Completely shutdown 27 facilities. (Mound)

FY 1996 Accomplishments (To Date and Planned):

- o Continue shutdown and disposal of related hazardous and LLW. (Pinellas)
- o Operate the treatment systems for the 4.5 Acre Site and Miscellaneous sites. (Pinellas)
- o Continue interim measures for the West Fenceline. (Pinellas)
- o Initiate/continue Building 200/Waste Neutralization assessment. (Pinellas)
- o Provide for public participation activities to ensure public acceptance of cleanup activities and decisions. (Pinellas)
- o Make required PRP contribution. (Pinellas)
- o Commence cleanup of the radioactive and hazardous material areas. (Pinellas)
- o Complete disposition of former DP equipment. (Pinellas)
- o Complete disposition of classified parts and records. (Pinellas Plant)

2645

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned) (con't)

- o Successfully characterized all mixed waste. (Mound)
- o Characterize and treat all Polychlorinated Biphenyl; Printed Circuit Board (PCB) and mixed waste oil. (Mound)
- o Develop plans to permanently remove all Transuranic Waste (TRU) waste. (Mound)
- o Implement ROD for OU1. (Mound)
- o Initiate removal action for OU4. (Mound)
- o Initiate two additional removal actions. (Mound)
- o Continue OU5 and OU9 Remedial Investigation/Feasibility Study (RI/FS). (Mound)
- o Continue assessment of building 21, SW/WD Building underground lines, and soils. (Mound)
- o Continue Decontamination and Decommissioning (D&D) of SM Area. (Mound)
- o Initiate D&D of Building 21. (Mound)
- o Continue D&D of underground lines and soils. (Mound)
- o Continue program management of D&D activities. (Mound)
- o Continue program management, community relations and Geographic Information Systems (GIS) development, in lieu of the costly RI/FS process. (Mound)
- o Develop and begin implementation of a project management to disposition the entire plant. (Mound)
- o Transfer 1.2g of plutonium and uranium to receiver sites, lower plant security to category III. (Mound)
- o Stabilize and repackage plutonium currently stored in T-Building. (Mound)
- o Completely shutdown 14 additional facilities. (Mound)
- o Complete non-nuclear reconfiguration program goals to support new Defense Program missions at designated receiver sites. (Mound)
- o Continue processing tritium units to support DP and cleanup activities, including shipping bulk tritium gas to Savannah River. (Mound)
- o Make 40 percent of the property releasable for sale or lease under CERCLA. (Mound)

FY 1997 Planned Accomplishments:

o Complete accelerated shutdown and disposal activities. (Pinellas)	$ 1,825
o Continue remediation at 4.5 Acre Site. (Pinellas)	690
o Complete assessment and remediation of Miscellaneous Sites. (Pinellas)	6,367
o Complete program management and PRP participation. (Pinellas)	464
o Complete disposition of all records, equipment, and materials. (Pinellas)	4,200
o Compete site-wide cleanup of buildings and systems and dispose of hazardous wastes. (Pinellas)	5,731
o Maintain site infrastructure to ensure safe working environments while completing all activities required for site departure. (Pinellas)	23,413
o Terminate the remaining 650 M&O employees. (Pinellas)	15,000
o Provide transition management, administrative, and planning activities. (Pinellas)	1,375

2646

III. Performance Summary (con't)

FY 1997 Planned Accomplishments (con't):

o Continue treatment and disposal of LLW and Mixed Wastes through shipment to NTS; shipment of mixed PCB waste to Toxic Substances Control Act (TSCA) Incinerator; and developing and submitting RCRA permit. (Mound)	6,788
o Continue OU1 ROD implementation. (Mound)	2,350
o Complete excavation activities for the Miami-Erie Canal removal action. (Mound)	8,360
o Continue soil removal projects. (Mound)	16,132
o Continue D&D of Building 21. (Mound)	2,107
o Continue OU2, OU5, and OU9 RI/FS (rebaselining will change OU numbers). (Mound)	2,470
o Continue program management, community relations, and GIS implementation in lieu of the costly RI/FS process. (Mound)	12,015
o Support budget development and site transition planning activities targeted toward the ultimate disposition of the Mound Plant. (Mound)	1,019
o Conduct surveillance to maintain all building safety envelopes. (Mound)	13,738
o Complete shutdown of 62 of 130 buildings. (Mound)	17,163
o Maintain site infrastructure to ensure safe working environments while supporting ongoing activities. (Mound)	4,100
TOTAL, FY 1997 Mound & Pinellas Project Office	$145,307

2647

Explanation of Funding Changes FY 1996 to FY 1997:

- o At the Pinellas Plant, additional funding of $1,609,000 will be used to implement Innovative Technology Remediation Demonstration (ITRD) projects to improve groundwater and in-situ soil treatment methodologies. Overall project completion date will be accelerated.
- o Increase of $15,000,000 will be used to terminate cost of remaining Pinellas M&O employees
- o Increase of $4,200,000 is due to disposition cost of records, equipment and other property at Pinellas.
- o Net reductions of $14,234,000 in Pinellas landlord and cleanup costs due to plant closeout and exit activities.
- o Reduction of $5,148,000 results from the lower safe shutdown program costs in FY 1997 and the impact of the successful implementation of the program in FY 1995 and FY 1996. This is principally seen in a lowering of the plant surveillance and maintenance activities, as well as the plant compliance activities. (Mound)
- o Productivity savings of $6,751,000 will be obtained through contract reform, process improvements, and privatization activities at Mound.

Major Issues:

- o None

SITE OPERATIONS - DEFENSE

PROGRAM INTEGRATION
(Tabular dollars in thousands, narrative in whole dollars)

I. Mission Supporting Goals and Objectives

The mission of the Office of Program Integration is to provide management systems and program specific technical support. Business management support is provided through the establishment of management plans and procedures, data management, systems, work breakdown structure, and baseline change control board. In addition, the Office serves as the focal point for program formulation and execution. The Office provides assistance to Site Operations in resolving crosscutting program and cross-field site issues. Benchmarking and performance goals development activities will be centered in this Office, as well as the responsibility for the Office of Site Operations Program Baseline Control Board System. Training under the Hazardous Waste Operations and Emergency Response (HAZWOPER) Standards is funded in this Office.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Program Integration	$ 12,011	$ 9,597	$ 9,704	+107	+1%
TOTAL, Program Integration	$ 12,011	$ 9,597	$ 9,704	+107	+1%

III. Performance Summary

FY 1995 Accomplishments:

- Provided internal program support, including development of management plans and program budget requests.
- Conducted worker training under requirements related to the HAZWOPER Standard. This involved Congressionally-mandated training of DOE workers and others associated with DOE EM activities such as the clean-up of hazardous substances, hazardous waste operations, and emergency response.

FY 1996 Accomplishments (To Date and Planned):

- Conduct training under HAZWOPER program. All full time and occasional clean-up workers and visitors must have, due to special hazards that exist at DOE hazardous waste sites, a minimum of 40 hours of training or 24 hours of training plus an 8-hour annual refresher training.
- Develop and establish all business management functions for the Office of Site Operations.
- Provide program specific planning guidance for the Office of Site Operations, including budget justification, WBS development, and issues resolution and is the focal point for crosscutting programmatic issues.

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned): (con't)

- o Establish and monitor performance indicators for landlord/support costs and develop benchmarks for use in comparing DOE landlord costs to measure against comparable industrial standards.
- o Develop and maintain Site Operations Program Baseline Control Board System.
- o Provide specialized assistance to Site Operations in accomplishing specific program-related tasks and functions.

FY 1997 Planned Accomplishments:

o Continue to fund training at DOE Nuclear Weapons Facilities and related sites under the HAZWOPER program.	$ 8,000
o Continue to act as Program focal point for plans, processes, implementing procedures, and systems for effective and efficient Program formulation, execution, and evaluation. Maintain and implement Site Operations benchmarking and value engineering programs. Continue maintaining databases, conducting analyses, and disseminating results and lessons learned, and maintaining Program Baseline Control Board System	1,704
TOTAL, Program Integration	$ 9,704

Explanation of Funding Changes FY 1996 to FY 1997:

- o None

Major Issues:

- o None

ENVIRONMENTAL AND REGULATORY ANALYSIS
(Tabular dollars in thousands, narrative in whole dollars)

I. Mission Supporting Goals and Objectives

The Office of Environmental and Regulatory Analysis advocates and champions the resolution of environmental, legal and regulatory issues that cut across many sites and do not readily fall within the purview of the primary business lines. The Office serves as a facilitator, analyst and coordinator for the operations offices and the EM Program Offices in resolving these crosscutting issues. The Office also functions as a team to promote cost efficiencies within EM programs by establishing effective lines of communication with the programs and sites to: identify and assist in resolving crosscutting environmental and regulatory issues; facilitate the timely resolution of crosscutting and regulatory issues with the Office of General Council (GC) and the Assistant Secretary for Environmental, Safety, and Health (EH); and provide timely information and assistance to Assistant Secretary for Environmental Management (EM-1), Office of the Principal Deputy Assistant Secretary for Environmental Management (EM-2), and Office of Site Operations (EM-70) on environmental and regulatory issues. The Office ensures that necessary policy direction and guidance is provided to the Operations and EM Program Offices to successfully implement the negotiation and enhancement of compliance and cleanup agreements. The Office provides guidance and technical assistance on the NEPA compliance issues and acts as EM's NEPA Compliance Officer to promote cost effective compliance across the EM program.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Environmental and Regulatory Analysis	$ 1,489	$ 415	$ 772	+357	+86%
TOTAL, Environmental and Regulatory Analysis	$ 1,489	$ 415	$ 772	+357	+86%

2650

III. Performance Summary

FY 1995 Accomplishments:

- o Developed a "Partnering" program to work with regulators in achieving more cost-effective and timely actions, and assisted in the development of high performance teams at Richland, Laboratory for Energy-Related Health Research (LEHR), and Mound, resulting in an estimated $275,000,000 of cost avoidance at Hanford and acceleration of cleanup by five years at LEHR.
- o Led the DOE participation on an Interagency Workgroup addressing EPA administrative reforms such as the lead regulator concept, development of risk-based priority setting, unified cleanup standards, and improved permitting procedures to enhance the cleanup of Federal Facilities.
- o Developed RCRA/CERCLA draft integration guidance that served to increase the awareness of EPA, States, and DOE field managers of the wasted resources resulting from current integration approaches that require dual regulatory compliance with RCRA and CERCLA remediation programs.
- o Supported the Assistant Secretary in improving the consideration of funding and increasing flexibility in enforceable environmental agreements by developing a "rolling milestone" approach and organized a National Enforcement Conference to discuss this approach with regulators and stakeholders.
- o Prepared an EM FY 1997 Missed Milestone Report for the Secretary, which identified enforceable milestones that may be missed in FY 1997 due to budget constraints or other programmatic reasons.
- o Prepared a report for the Secretary that detailed the status of regulator discussions on the FY 1997 budget and compliance impacts of reduced funding.
- o Supported the Office of Waste Management in various aspects of Federal Facility Compliance Act implementation, including review of draft site treatment plans for the treatment of mixed waste and compliance orders implementing the plans.
- o During the first session of the 104th Congress, coordinated the EM response to 109 pieces of proposed legislation, testimony, agency reports, and Secretarial letters, including United States Enrichment Corporation (USEC) privatization, deactivation privatization, risk assessment, Superfund reform, the National Defense Authorization Act, and Hanford efficiency legislation.
- o Supported program and field offices in negotiating and gaining approval of new AIPs for Alaska and Missouri and renegotiated AIP for Idaho.
- o Developed new guidance on AIP program policies, agreement language, and the Headquarters approval process for AIPs.

FY 1996 Accomplishments (To Date and Planned):

- o Develop and implement "Partnering" programs for the Tank Waste Remediation System (TWRS) and the Environmental Restoration Program at Hanford to work with regulators in achieving more cost-effective and timely actions, including an estimated $200,000,000 of cost avoidance at Hanford.
- o Participate on Interagency Workgroups and the Senior Management Team addressing implementation of EPA administrative reforms such as the lead regulator concept, development of risk-based priority setting, unified cleanup standards, and improved permitting procedures to enhance the cleanup of Federal Facilities.

2651

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned): (con't)

- o Support the Assistant Secretary in improving the consideration of funding and increasing flexibility in enforceable environmental agreements.
- o Prepare an EM FY 1998 Missed Milestone Report for the Secretary, to identify enforceable milestones that may be missed in FY 1998 due to budget constraints and other programmatic reasons.
- o Support the Office of Waste Management in various aspects of Federal Facility Compliance Act implementation, including review of site treatment plans for the treatment of mixed waste and compliance orders implementing the plans for the Nevada Test Site, West Valley Demonstration Project and Brookhaven National Laboratory.
- o Establish an EM INTERNET WEB Page that provides access to enforceable cleanup and compliance agreement information and milestone commitments.
- o Respond to proposed legislation, testimony, agency reports, and Secretarial letters.
- o Support program and field offices in renegotiating and gaining approval AIPs for the States of Texas and Mississippi and new AIPs as required.
- o Issue guidance on the EM Headquarters and field process to approve cleanup and compliance agreements.
- o Develop an EM-wide NEPA database that provides technical information on ongoing and approved NEPA actions.
- o Issue EM NEPA procedures guidance.
- o Begin development of technical guidance for preparation of standardized EM NEPA documents.

FY 1997 Planned Accomplishments:

PARTNERING/TEAMING ACTIVITIES $300

- o Develop and implement "Partnering" programs for additional sites to work with regulators in achieving more cost-effective and timely actions.
- o Facilitate the forming of high-powered corporate teams with DOE and regulatory officials that will work to resolve environmental and compliance issues and achieve more cost-effective and timely actions.

ENVIRONMENTAL AND REGULATORY ANALYSIS ACTIVITIES 172

- o Participate on Interagency Workgroups addressing EPA administrative reforms.
- o Support the Assistant Secretary in improving the consideration of funding and increasing flexibility in enforceable environmental agreements.
- o Prepare an EM FY 1999 Missed Milestone Report for the Secretary, to identify enforceable milestones that may be missed in FY 1999 due to budget constraints and other programmatic reasons.

2652

SITE OPERATIONS - DEFENSE - ENVIRONMENTAL AND REGULATORY ANALYSIS (con't)

III. Performance Summary (con't)

FY 1997 Planned Accomplishments: (con't)

ENVIRONMENTAL AND REGULATORY ANALYSIS ACTIVITIES (con't)

- o Respond to proposed legislation, testimony, agency reports, and Secretarial letters.
- o Update the EM INTERNET WEB Page that provides access to enforceable cleanup and compliance agreement information and milestone commitments.
- o Support program and field offices in renegotiating and gaining approval of AIPs for the States of Kentucky and Tennessee, and new AIPs as required.

NEPA ACTIVITIES	300

- o Update an EM-wide NEPA database that provides information on ongoing and approved NEPA actions.
- o Develop technical guidance for preparation of EM NEPA documents.
- o Begin assessment of technical models to be used in preparing EM NEPA documents.
- o Develop standardization norms for preparation of NEPA documents for EM projects.

TOTAL, FY 1997 Environmental and Regulatory Analysis	$772

2653

Explanation of Funding Changes FY 1996 to FY 1997:

- o Increase of $200,000 is due to increased site presence to facilitate and implement partner/teaming programs to work with regulators in achieving more cost-effective and timely actions by streamlining regulatory strategies.
- o Increase of $157,000 is due to increased role in assessing and implementing standard administrative and technical procedures in preparing EM NEPA documents, including technical model analysis to drive down the costs of preparing EM NEPA documentation.

Major Issues:

- o None

TRANSPORTATION, EMERGENCY MANAGEMENT, AND CHARACTERIZATION MANAGEMENT

(Tabular dollars in thousands, narrative in whole dollars)

I. Mission Supporting Goals and Objectives

The Office of Transportation, Emergency Management, and Characterization Management is responsible for the Department-wide transportation, packaging, and transportation emergency preparedness function. This Office is also responsible for EM corporate emergency management and analytical services policy decisions, and program development. Activities in the three program areas support the following Office goals:

- o Assist the field in arranging for safe, economical, and regulatory-compliant transportation of DOE materials.
- o Enhance safety and increase efficiency by providing standardized methods and tools for the management of DOE transportation activities.
- o Certify and approve DOE hazardous material packaging for use.
- o Assure availability of appropriate packaging and technologies to support transportation of DOE materials.
- o Provide capability for preparedness in the event of an operational emergency involving DOE shipments of hazardous materials.
- o Advance EM's analytical services to a superior level of efficiency, productivity, accountability, and rigor.
- o Ensure that Federal, tribal, state, and local emergency responders have the policies, training, and equipment necessary to safely and efficiently respond to accidents and incidents involving DOE unclassified radioactive material.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Transportation Management	$ 21,284	$ 11,647	$ 9,894	$ -1,753	-15%

2655

TRANSPORTATION MANAGEMENT

I Mission Supporting Goals and Objectives

The Secretary's Alignment Initiative #38 was established in FY 1995 to realign and reengineer the Department's transportation and packaging activities. The recommended approach was to consolidate corporate transportation and packaging activities into one Headquarters organization and to reengineer the transportation and packaging operations over the next several years. This approach provides a single voice for transportation and packaging issues and develops systematic, comprehensive, and consistent approaches to perform Departmental transportation and packaging activities more efficiently and effectively. The first step in the initiative was to consolidate the transportation and packaging safety activities of the Packaging Certification and Transportation Safety activity in EH with the Transportation Management Program.

Within the Department of Energy, the Transportation Management Program has the overall responsibility (except weapons, weapons components, and commercial irradiated fuel) of assuring the proper packing, shipment, and receipt of hazardous materials (particularly radioactive) and hazardous wastes and substances. This Department-wide program provides the complex with the corporate level (crosscutting) policy, direction, tools and technical assistance necessary to enable the sites to move DOE materials safely, legally, and in a cost-effective and efficient manner. The Program assures the uninterrupted flow of all goods and materials of the Department to achieve production, waste management, and environmental restoration goals and objectives. The Program is responsible for the coordination of DOE-wide integrated transportation and packaging research, development, testing, and evaluation programs, and support for regulatory initiatives.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Transportation Management	$ 21,284	$ 11,647	$ 9,894	$ -1,753	-15%

III. Performance Summary

FY 1995 Accomplishments:

- o Developed and implemented new DOE Order 460.2, "Departmental Materials Transportation and Packaging Management."
- o Operated, maintained, and provided support for existing transportation automation systems.
- o Established a cooperative agreement with the GSA to utilize the Automated Transportation Management System as the standard, nation-wide automated system for the movement of domestic freight (government-wide cost-savings initiatives).
- o Issued a catalog of approved Department of Transportation Specification 6M packaging, including procedures for resubmitting newly developed packaging for approval.
- o Developed the Hedgehog, which is a Type A shielded packaging for transporting liquids up to one liter.
- o Developed and supported ballot of Phase I American National Standards Institute N14.31 "Wire Rope Tiedown Standard for Radioactive Materials Packages."
- o Renegotiated DOE-wide less-than-truckload rate agreements for increased cost savings on transportation activities.
- o Developed (jointly with DOE Office of Civilian Radioactive Waste Management) route selection guidance recommendations for DOE shipments of Highway Route Controlled Quantities of radioactive materials.
- o Developed Transportation Routing Analysis Geographic Information System (GIS) model/database for rail and water networks.
- o Developed the Hazardous Materials Awareness Computer Based Training Program to assist the DOE sites in complying with Federally-mandated training requirements on the preparation of hazardous materials shipments for off-site transport.
- o Produced a three-part hazardous materials video for first responders in a joint activity with the Department of Transportation.
- o Provided assistance in support of the Urgent Relief Acceptance of Foreign Reactor Spent Nuclear Fuel and the Cesium Capsule Return Program shipping campaigns.
- o Completed a Congressionally-mandated study and implementation plan for the "Safety of Shipments of Plutonium by Sea."
- o Participated in a follow up study on "Safety of Shipments of Plutonium by Sea" with the International Atomic Energy Agency/International Maritime Organization (IAEA/IMO) to evaluate the risk of transporting radioactive materials by sea.
- o Initiated the realignment/reengineering of the Department's transportation and packaging activities.

2656

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned):

- Operate and maintain the Automated Transportation Management System at DOE sites and work with the GSA to implement as a national system, with a potential cost savings of $20,000,000 annually.
- Operate the Department's computerized Satellite Communications and Tracking System (TRANSCOM)
- Update the Hazardous Materials Modular Training Program and the computer-based training program, maintain the advanced level transportation training program courses, and provide updates to the DOE sites and external users to meet Federally-mandated training requirements. This program provides significant cost-savings to the Department.
- Integrate shielding analysis into design tools to allow simultaneous coordination of structural and thermal design constraints for radioactive materials packaging.
- Continue integration of GIS data into transportation risk analysis tools, (e.g., Radioactive Materials Transportation Risk Model).
- Maintain the Transportation Routing Analysis GIS for rail, waterway, and highway modes.
- Conduct DOE-wide transportation rate/service agreement negotiations to assure the lowest cost carriers for DOE shipments.
- Facilitate Centralized Packaging Procurement initiative to reduce overall Departmental cost for standardized packaging.
- Continue review of the Department's transportation and packaging operations and subsequent reengineering activities.

FY 1997 Planned Accomplishments:

- Operate and maintain the Automated Transportation Management System, and its components, Prospective Shipments Module, Rate/Route Module; conduct "lessons learned" evaluation for improving efficiency and economy; and, implement necessary updates.	$ 1,000
- Operate TRANSCOM.	500
- Maintain transportation operations and traffic management programs, including: assuring only highly qualified carriers transport DOE hazardous materials, conducting commercial carrier rate/service negotiations, conducting site regulatory compliance evaluations and providing technical assistance, maintaining the Departmental materials packaging clearinghouse to improve packaging utilization and selection, and administering the Departmental Explosives Classification and Registration program.	1,084
- Update the Hazardous Materials Modular Training Program and the computer-based training program, maintain the advanced level transportation training program courses, and provide updates to the DOE sites and external users to meet Federally-mandated training requirements.	1,000
- Provide technical analyses and studies for transportation and packaging standards development, and development of national and international radioactive transportation and packaging regulations.	1,500
- Continue development of engineering analysis and design tools and new materials investigations to improve packages for unique radioactive materials.	2,550

2657

III. Performance Summary (con't)

FY 1997 Planned Accomplishments: (con't)

o Operate, maintain, and continue development of Departmental transportation risk analysis tools in support of Environmental Assessment/Environmental Impact Statement, and continue work associated with the "Safety of Shipments of Plutonium by Sea".	1,500
o Convene at least six integration and information forums for DOE programs and external parties, including the local government workshops and the Transportation External Coordination Working Group to continue improved external stakeholder communications to ensure appropriate level of stakeholder involvement in DOE shipping activities.	760
TOTAL, FY 1997 Transportation Management	$ 9,894

PACKAGING CERTIFICATION AND TRANSPORTATION SAFETY

I. Mission Supporting Goals and Objectives

This program is budgeted within the Office of Environment, Safety, and Health, Office of Nuclear Facilities Safety at a total of $5,700,000; however, through a strategic alignment initiative, it is being managed by the Office of Environmental Management, Office of Site Operations. The budget for this activity will be moved to EM in FY 1998. Activities include developing, coordinating, and implementing policies, standards, and guidance related to aviation, maritime, rail, highway, pipeline, and hazardous materials safety; performing evaluations and analyses of safety analysis reports for packaging; providing external coordination between the Department and other governmental, commercial, and international bodies regarding transportation safety and packaging certification; participating in the development of transportation safety and packaging standards by national and international organizations; coordinating within the Department all matters pertaining to hazardous materials package certification and transportation safety; overseeing field aviation, maritime, rail, highway, and pipeline safety implementation activities as they relate to the transportation of personnel and hazardous materials. Packaging Certification and Transportation Safety manages the hazardous materials packaging safety programs to ensure safety in all modes of transport, including air, rail, water, highway, and pipeline.

EMERGENCY MANAGEMENT

I. Mission Supporting Goals and Objectives

The Emergency Management Program provides the Department with the capability for preparedness in the event of an operational emergency involving shipments of DOE non-weapon radioactive and hazardous materials in transit. It also provides the Office of Environmental Management with the capability for preparedness in the event of an operational emergency at EM facilities.

II. Funding Schedule:

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Emergency Management	$ 2,962	$ 464	$ 3,150	$ +2,686	+579%

III. Performance Summary

FY 1995 Accomplishments:

- Managed the transportation emergency preparedness training program, which covered a wide spectrum of training areas, ranging from a basic orientation workshop to advanced emergency management procedures.
- Updated the Criteria for Evaluation of Operational Emergency Plan to include Federal regulatory requirements and published the document in conjunction with the DOE Offices of Defense Programs and Energy Research.
- Assisted several EM field elements in planning, training, and exercises supporting the Transportation Emergency Preparedness Program.
- Completed the review and yearly update of several EM Headquarters planning documents, including the EM Operational Emergency Plan, the Emergency Preparedness Implementation Procedures, and EM Headquarters Drills and Exercise Plan.
- Developed the FY 1995 EM Consolidated Emergency Readiness Assurance Plan.
- Managed the EM Duty Officer Program and the emergency management team.

FY 1996 Accomplishments (To Date and Planned):

- Develop the Department of Energy Transportation Emergency Preparedness Guide, which will provide for a more comprehensive and standardized program throughout the DOE complex.
- Develop emergency response training materials for use by State, Tribal, and local governments to train responders in safe, efficient, and effective procedures for transportation accidents involving for radioactive materials.
- Operate the Department of Energy's training program for Federal, State, Tribal, and local emergency responders to transportation accidents involving DOE radioactive materials.

2659

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned): (con't)

- o Integrate EM programmatic emergency management needs into the Department-wide emergency management system.
- o Administer the technical response portion of the EM Operational Emergency Management Team. This team is the Department's Headquarters vehicle for responding to operational emergencies.

FY 1997 Planned Accomplishments:

o Initiate the implementation of a comprehensive Transportation Emergency Preparedness exercise program and technical assistance program for the Department of Energy.	$ 1,019
o Initiate implementation of a new Transportation Emergency Preparedness training program, Transportation Emergency Preparedness Program national plan and a new field assistance program.	1,000
o Complete Transportation Emergency Preparedness Guide, which provides for a standardized comprehensive program for the Department of Energy	231
o Continue to operate Transportation Emergency Preparedness training program for Federal, State, Tribal, and local governments	500
o Develop a national standard for radioactive materials response equipment.	200
o Review five high priority facility emergency plans by the end of FY 1997.	70
o Provide for Headquarters participation in three facility emergency response exercises.	30
o Provide direction for a national transportation, full field exercise in FY 1997.	100
TOTAL, Emergency Management, FY 1997	$ 3,150

2660

CHARACTERIZATION MANAGEMENT

I. Mission Supporting Goals and Objectives

The Characterization Management Program is responsible for supporting all EM programs to assure that credible, cost-effective sampling and analytical needs are met. These analytical programs assure that the data vital for making correct decisions regarding waste operations and environmental remediation are available, and meet the needs of EM, regulators, and the public. It provides guidance, training, and technical assistance to field sites in applying the Data Quality Objectives process across all EM characterization data planning, and in applying the Streamlined Approach to Environmental Restoration to remediation projects. The program provides EM guidance, training, and assistance to the field in establishing and maintaining a cost-effective quality assurance programs, including assistance with laboratory performance evaluation programs to ensure that EM uses only reliable laboratories for its programs. This involves evaluations of commercial labs to reduce or eliminate duplicative audits of the same laboratories by multiple field offices. The program assists in establishing integrated Field Sample Management Programs at each operations office to centralize and optimize business management of their characterization system, and consolidates EM analytical needs and available lab capacity. It also provides the EM standard guidance on contracting for analytical services and standardizing specifications for automating data management and review processes to save substantial time, cost, and elimination of duplicate efforts.

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Characterization Management	$ 13,201	$ 1,512	$ 6,452	$ +4,940	+327%

III. Performance Summary

FY 1995 Accomplishments:

- Saved $11,500,000 through improved field business practices as they relate to obtaining analytical services.
- Utilized sampling needs and capacity projections in field decisions on reconstructing/streamlining analytical laboratories at Idaho and Hanford and projecting transportation requirements of samples and materials.
- Assisted the field on Data Quality Objectives/Streamlined Approach for Environmental Restoration (DQO/SAFER) planning for specific projects, which saved $16,000,000 in FY 1995 due to avoidance of unnecessary sampling and analyses.
- Provided a program to evaluate the ability of laboratories to analyze samples containing both hazardous and radioactive constituents.
- Published an updated Methods Compendium with technically accepted sample analysis procedures for EPA defined hazardous constituents in radioactive waste.

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned):

CHARACTERIZATION PLANNING AND EVALUATION ACTIVITIES

- o Assist Headquarters and the field in executing DQO/SAFER planning on specific projects to ensure only the data type and data quality required for decision making are collected.
- o Work with EPA to define and promote the use of Data Quality Assessment processes to assure that data collected meets the intended uses as defined by the DQO/SAFER process.
- o Continue site-wide characterization effort, including characterization of background surficial soils, seep of low measurement, geophysical logging aquifer testing, 3-dimensional computer modeling of hydrogeology, and monitoring of new and existing monitoring wells at reduced levels; continue management of the Rocky Flats Environmental Restoration Database and analytical support services.

SAMPLING AND ANALYSIS QUALITY ASSURANCE ACTIVITIES

- o Assist field in establishing and maintaining quality assurance programs for sampling and analysis.
- o Provide in-house performance evaluation of laboratories providing analyses of samples containing low-level (environmental or ambient) and higher-level radioactivity and mixed radiological-hazardous constituents.
- o Work with the field and Headquarters to provide management and technical evaluations of environmental sampling and analysis activities carried out in the field.

CHARACTERIZATION SYSTEM OPTIMIZATION ACTIVITIES

- o Provide support to the field in establishing infrastructure and systems to manage the costs of sampling and analysis programs that meet DOE commitments to the General Accounting Office (GAO) and Congress.
- o Provide the field with models for the projection of analytical needs and capacities to cost-effectively allocate environmental samples between in-house and commercial laboratories.

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned): (con't)

CHARACTERIZATION SYSTEM OPTIMIZATION ACTIVITIES (con't)

- o Provide guidance for laboratory contracting consistency and for standardizing electronic data delivery, and coordinate procurement approaches with the Office of Human Resources and Administration (HR).

METHODS AND INSTRUMENTATION

- o Develop and/or validate laboratory methods for analyzing radioactive and mixed waste samples that meet regulatory requirements. Existing hazardous constituent analytical methods and associated equipment were not designed to handle radioactive samples.
- o Provide analytical methods that are less costly, less time consuming, and that generate less laboratory mixed waste than current methods.

FY 1997 Planned Accomplishments:

CHARACTERIZATION PLANNING AND EVALUATION ACTIVITIES ..... $ 3,175

- o Continue to assist Headquarters and the field in executing DQO/SAFER planning on specific projects to ensure that only types and quality of data required for decision making are collected.
- o Continue the collaboration with EPA to define and promote the use of Data Quality Assessment processes to assure that data collected meet the intended uses as defined by the DQO/SAFER process.
- o The performance measures for the success of these programs are decreased cost of characterization and assurance of regulatory acceptance of the data.

SAMPLING AND ANALYSIS QUALITY ASSURANCE ACTIVITIES 800

- o Continue to assist the field in establishing and maintaining quality assurance programs for sampling and analysis. The performance measure for the success of this program is increased quality of the characterization data that ensures EM milestones are met as scheduled.
- o Provide in-house performance evaluation of laboratories providing analyses of samples containing low-level (environmental or ambient) and higher-level radioactivity and mixed radiological-hazardous constituents. The success of the program is measured through the use of this information by the field to assure the utilization of only credible laboratories for sample analyses. Continue to provide management and technical evaluation support and assistance to the field and Headquarters for environmental sampling and analysis activities carried out in the field.

2663

III. Performance Summary (con't)

FY 1997 Planned Accomplishments: (con't)

CHARACTERIZATION SYSTEM OPTIMIZATION ACTIVITIES 1,752

- o Provide systems management support to the field to control the costs of sampling and analysis programs. The performance measure associated with this program is a reduction in the cost of characterization and meeting commitments to GAO.
- o Continue to provide the field with new and updated models for the projection of analytical needs and capacities to cost-effectively allocate environmental samples between in-house and commercial laboratories. The performance measure for this program is a reduction in the cost of characterization due to optimization of capacity use.
- o Support laboratory efforts towards maintaining contracting consistency and standardization of electronic data delivery. The success of this program will be measured by a decrease in the cost of analytical services in conjunction with an accelerated schedule.

METHODS AND INSTRUMENTATION 725

- o Continue the development and/or validation of laboratory methods for analyzing radioactive and mixed waste samples that meet regulatory requirements. Previous hazardous constituent analytical methods and associated equipment were not designed to handle radioactive samples. The success of this program will be measured by the number of methods that gain EPA regulatory acceptance and are provided in the compendium.
- o Continue to provide analytical methods that are less costly, less time consuming, and that generate less laboratory mixed waste than current methods. The success of this program will be measured by a reduction in the cost and time associated with characterization and a reduction in the amount of mixed waste generated.
- o Perform analytical services and maintain the analytical facilities which sample over 70,000 items per year for Liquid Stabilization, Thermal Stabilization, Residue Elimination, Environmental Monitoring, Waste Management, Waste Characterization, Environmental Restoration, and Worker Protection Programs. Maintain the analytical and non-nuclear production facilities by performing surveillance and maintenance activities and by providing building support functions.

TOTAL, Characterization Management, FY 1997 ..... $ 6,452

2664

SITE OPERATIONS - DEFENSE - TRANSPORTATION, EMERGENCY MANAGEMENT, AND CHARACTERIZATION MANAGEMENT (con't)

Explanation of Funding Changes FY 1996 to FY 1997:

Transportation:

- o Decrease of $1,000,000 will increase risk of an inappropriate transportation mode or package being used to transport hazardous materials, resulting in fines from the regulating agencies and/or loss of public confidence in DOE shipments.
- o Decrease of $700,000 will delay implementation of the automated logistic system will be delayed. These systems reduce the cost of DOE transportation transactions and allow State, Tribal, and local officials access to DOE transportation information.

Emergency Management:

- o Increase of $1,000,000 provides for the Department's transportation emergency exercise program at a time when DOE shipments are dramatically increasing and the perception of risk by State, Tribal, and local officials is increasing.
- o Increase of $1,000,000 provides for radiological emergency responder training along shipping corridors to ensure DOE shipments move without interruption.
- o Increase of $700,000 is provided for the facility emergency exercise program to ensure worker safety at EM facilities.

Characterization Management:

- o Increase of $1,100,000 provides the potential to increase the return on investment gained by site-specific project planning utilizing advanced characterization techniques.
- o Increase if $1,000,000 will provide for the continued development of decision support software that defines data collection needs and identifies candidate sampling locations.
- o Increase of $800,000 will continue the program that develops, validates, and compiles methods and instrumentation for radioactive and mixed waste samples.
- o Increase of $2,000,000 will continue the development of infrastructure necessary to manage sampling and analysis business activities and assure the quality of the laboratory performance evaluation program.

Major Issues:

- o None

OFFICE OF POLLUTION PREVENTION

(Tabular dollars in thousands, narrative in whole dollars)

I. Mission Supporting Goals and Objectives

The Department of Energy (DOE) Pollution Prevention mission is to reduce generation and release of multi-media wastes and pollutants by implementing cost-effective waste minimization and pollution prevention technologies, practices, and policies, while conducting the Department's operations in compliance with applicable environmental requirements. The Office of Pollution Prevention is responsible for implementing the Department's Pollution Prevention mission.

The primary objective of the Department's pollution prevention program is to reduce the generation of all waste streams in order to minimize the impact of the Department's operations on the environment, reduce operational cost, and improve the energy efficiency and health and safety of its operations. Pollution prevention is also required by various federal laws and Executive Orders, including but not limited to: Pollution Prevention Act of 1990; Resource Conservation and Recovery Act (RCRA); Emergency Planning and Community Right-to-Know Act (EPCRA); and Executive Order 12856.

The Department's Pollution Prevention program will affect all of its program elements, including Environmental Management, Defense Programs, Nuclear Energy (NE), and Energy Research. Ten Operations Offices (with 30 major sites) have site-wide pollution prevention programs, including Albuquerque, Oak Ridge, Savannah River, Idaho, Rocky Flats, Richland, Chicago, Oakland, Nevada, and Ohio.

2666

In FY 1996, EM is seeking to establish aggressive DOE-wide Secretarial goals, to be achieved by December 31, 1999, as follow:

- o Reduce total releases and offsite transfers for treatment and disposal of Emergency Planning and Community Right-to-Know Act (EPCRA) 313 toxic chemicals from routine operations by 50 percent.
- o Reduce the generation of radioactive waste from routine operations by 50 percent.
- o Reduce the generation of low-level mixed waste from routine operation by 50 percent.
- o Reduce the generation of hazardous waste from routine operations by 50 percent.
- o Reduce the generation of sanitary waste from routine operations by 33 percent.
- o Divert from recycling 33 percent of sanitary waste from all operations.
- o Increase the affirmative procurement of EPA-designated recycled products to 100 percent except where they are not available competitively at a reasonable price or do not meet performance standards.

Progress toward achieving the goals will be determined by using 1993 as the baseline year.

SITE OPERATIONS - DEFENSE - POLLUTION PREVENTION

II. Funding Schedule

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Pollution Prevention	$ 29,257	$ 20,004	$ 23,854	+3,850	+19%
TOTAL, Pollution Prevention	$ 29,257	$ 20,004	$ 23,854	$ +3,850	$ +19%

III. Performance Summary

FY 1995 Accomplishments:

- Initiated the second round of the High Return-On-Investment (ROI) Program, which identified projects with over $80,000,000 of annual savings.
- Prepared reports to Federal Environmental Executive on compliance with Executive Order 12973 and 12856 regarding the Department's program and progress in reducing waste, recycling excess material, and purchasing EPA-designated recycled material.
- Pilot tested pollution prevention tools for new design for three projects, and trained over 250 DOE personnel across the complex on the use of the tools.
- Provided funds to implement over 50 projects that reduce waste and return over double the cost of the projects in annual savings to DOE.
- Provided technical support, training, and tools to reduce cost of program development to the field.
- Compiled information on complex-wide waste generation rate to be used as baseline to measure future pollution prevention progress.
- Operate site-wide pollution prevention programs at ten Operations Offices with 30 sites that comply with Federal regulations and Executive Orders, and which are consistent with the guidance in the 1994 Waste Minimization/Pollution Prevention Crosscut Plan.

III. Performance Summary (con't)

FY 1996 Accomplishments (To Date and Planned):

- o Initiated pilot generator set-aside program at three Operations Offices. When fully implemented, this program will make waste generators more accountable for the waste they generate.
- o Issue new Pollution Prevention Program Plan with Secretarial goals to focus the Department's pollution prevention effort.
- o Issue the Annual Waste Generation and Waste Minimization/Pollution Prevention Accomplishment Report for the 1993 and 1994 period.
- o Increase collaborative efforts with other organizations such as Field Management (FM) to coordinate HQ guidance to the field.
- o Serve as champion for the Round 2 High ROI projects to obtain funding from DP, Energy Research, and EM.
- o Initiate the development of a consistent and coordinated EM wide pollution prevention program.
- o Provide pollution prevention inputs to other initiatives such as Baseline Environmental Management Report (BEMR), Defense Nuclear Facilities Safety Board (DNFSB-94-2), and EM/DOE budget calls.
- o Continue tracking Field progress and prepare reports to meet Executive Orders requirements.
- o Continue to develop and maintain the site-wide pollution prevention programs. The priority items are identification and implementation of ROI projects.
- o Implement high ROI projects with avoided cost of $100,000,000 within ten years.
- o Reduce generation of hazardous, low-level, and mixed waste by 180,000 cubic feet total, with 1993 as baseline year.

2668

FY 1997 Planned Accomplishments:

- o Implement a DOE-wide Pollution Prevention Program by conducting the following activities: 12,384
  - o Provide technical Support to the field to develop their generator set-aside and ROI programs;
  - o Provide technical support, training, and tools across the complex;
  - o Compile site information and assess field performance by using standard performance measures;
  - o Establish program which identifies ROI projects that cross organizational lines;
  - o Continue efforts to comply with Executive Orders;
  - o Develop benchmarking field pollution prevention program; and
  - o Provide coordination and support at Headquarters and field to develop and implement consistent pollution prevention program across the complex.

SITE OPERATIONS - DEFENSE - POLLUTION PREVENTION (con't)

FY 1997 Planned Accomplishments: (con't)

- Review/refine/operate the site-wide pollution prevention programs to be consistent with the Secretarial reduction goals as stated in the DOE 1996 Pollution Prevention Program Plan. Shift emphasis to achieve the overall Departmental pollution prevention objectives of: 11,470

  - Establish Operations Office ROI program;
  - Implement incentive programs;
  - Achieve the Secretarial reduction, recycling, and procurement goals; and
  - Implement pollution prevention programs that are in compliance with requirements of regulations and Executive Orders. Reduce waste by 20 percent from the 1993 baseline and implement ROI programs which will realize cost avoidance/savings of $100,000,000 within ten years across the complex.

Total, FY 1997, Pollution Prevention 23,854

Explanation of Funding Changes FY 1996 to FY 1997:

- Increase of $3,850,000 will be used to replace critical activities reduced during FY 1996.

2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 2nd Quarter FY 1996

3b. A-E Work (Titles I and II) Duration: 14 months

4a. Date Physical Construction Starts: 4th Quarter FY 1997

4b. Date Construction Ends: 1st Quarter FY 1999

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $12,930
Total Project Cost (TPC) -- $13,726

6. Current Cost Estimate: a/
TEC -- $10,879
TPC -- $11,676

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1996	$ 1,039	$ 0	$ 1,039	$ 1,039
1997	6,790	0	6,790	2,734
1998	3,050	0	3,050	6,033
1999	0	0	0	1,073

a/ The TEC and TPC has been reduced (TEC $14,000,000 to $10,879,000 / TPC $10,879,000 to $11,676,000) under an approved baseline change proposal. The reductions are a result of 1) FY 1996 indirect cost reductions associated with the Nuclear Material and Facility Stabilization productivity initiative and 2) overall reductions to costs associated with project and construction management activities, and reductions in prioritized workscope.

2677

1. Title and Location of Project: Electrical Distribution Upgrade, Idaho
Idaho National Engineering Laboratory, Idaho

2a. Project No.: 96-D-461 ADS# ID-6318-0
2b. Construction Funded

8. Project Description, Justification and Scope

The Idaho National Engineering Laboratory's (INEL) Electrical Distribution Upgrade provides for the planning, management, design, procurement, and construction activities to upgrade portions of the INEL electrical distribution system which provides numerous users with reliable electrical power. This project is necessary to provide reliability and maintainability of the electrical distribution system.

The upgrade consists of 1) resolution and correction of code and standard deficiencies, and 2) correction of age, deterioration and obsolescence conditions. The extent of scope of this project will start at the secondary connections of the 138 kilovolts (kV) step down transformers and go to the service disconnects at the utilization area. The scope will include but not be limited to such things as conductor deterioration, conductor termination, electrical clearance and sag, pole and pole hardware general condition, transformer condition, transform hardware and grounding condition, general electrical grounding, transformer pad and electrical duct deterioration, substation interior and fencing requirements, minimum required protective relaying, fusing and circuit breaker protection, and any other unsafe, worn out, or insufficient condition found whether governed by a code requirement or not. These items have been identified as major items of scope; however, additional deficiencies identified during studies and design efforts will be prioritized and included in this project as funding allows.

This project will upgrade portions of the electrical distribution system which supplies electrical power to numerous users at the INEL including nationally recognized energy research programs, nuclear reactor test research programs, radioactive waste reduction/processing facilities, and associated safeguard and security facilities throughout the 900 square miles of the INEL.

The INEL electrical system comprises 65 miles of overhead transmission lines and seven substations. Each of these substations feeds users through electrical distribution systems. These systems include substation equipment, overhead/underground distribution lines, distribution equipment, and service entrance drops. Most of the system was installed circa 1950 and requires upgrades to maintain its reliability and maintainability. The INEL Electrical Upgrade (FY 1993) project addresses the upgrades required on the 138 kV transmission system. This project addresses the distribution system on the load side of the 138 kV step down transformer to the service disconnects at the utilization area.

The electrical distribution system has operated reliably and an excellent safety record has been maintained over the past years. However, safety codes deemed applicable to the INEL have changed as have requirements and applicable codes enforced at the time of construction. This has resulted in numerous violations of the present design with these safety codes. It is necessary that the system changes be made, so that existing codes and standards can be adhered to and a high level of safety and reliability be maintained.

If deficiencies are not corrected, it is expected that the system will degrade below acceptable reliability and maintenance levels, as various system components, which already exceed their design life, continue to age. Routine system maintenance is becoming increasingly difficult and expensive to accomplish. Spare parts from many of the system components are no longer available from the manufacturer or are difficult to obtain due to obsolescence. Spare parts used for repairs are often obtained by cannibalizing standby equipment or rebuilding failed components. This leads to increased system downtime and the potential for recurring failure, since these parts have the same age associated problems.

10. Method of Performance

The Department of Energy Idaho Operations Office (DOE-ID) shall be responsible for implementation of the project, including selection of principal contractors and approval of specified procurement actions. DOE-ID project management shall be performed by Construction Management, Office of Program Execution. Administrative and other project support shall be furnished to the project on a matrix basis by the DOE-ID organization.

The Lockheed Idaho Technologies Company (LITCO) shall be the operating contractor responsible for the development of the project's technical requirements, completion of the Architectural and Engineering Design, review and management of the engineering and construction activities, procurement of selected equipment, construction subcontracting, checkout of systems, and maintenance of the completed project. The LITCO project management and construction management shall be performed by the Site Services Organization as required to complete the project in a timely, safe, and cost effective manner.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
   1. Total facility costs--Narrative not required.
   2. Other project costs
      (a) R&D necessary to complete construction--Narrative not required.
      (b) Conceptual design costs--$350,000 was required for the completion of field inspections and conceptual design.

b. Other related annual funding
   1. Annual facility operating costs--Not available at this time.
   2. Programmatic operating expense directly related to the facility--None.
   3. Capital equipment not related to construction but related to the programmatic effort in the facility--None.
   4. Maintenance, repair, GPP, or other construction related to the programmatic effort in the facility--None.

DEPARTMENT OF ENERGY
FY 1997 CONGRESSIONAL BUDGET REQUEST
(Changes from the FY 1996 Congressional Budget Request are denoted by a vertical line in the left margin.)

OFFICE OF SITE OPERATIONS
DEFENSE ENVIRONMENTAL RESTORATION AND WASTE MANAGEMENT
(Tabular dollars in thousands. Narrative material in whole dollars.)

1. Title and Location of Project: Environmental Monitoring Laboratory, Savannah River, Aiken, South Carolina

2a. Project No.: 96-D-470 ADS# SR-6985-23
2b. Construction Funded

3a. Date A-E Work Initiated: 2nd Quarter FY 1997

3b. A-E Work (Titles I & II) Duration: 15 months

5. Previous Cost Estimate
Total Estimated Cost (TEC) -- $33,000
Total Project Cost (TPC) -- $36,000

4a. Date Physical Construction Starts: 4th Quarter FY 1998

4b. Date Construction Ends: 2nd Quarter FY 2000 b/

6. Current Cost Estimate: a/
TEC -- $30,280
TPC -- $33,690

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1997	$ 2,500	$ 0	$ 2,500	$ 1,850
1998	5,200	0	5,200	4,620
1999	18,300	0	18,300	18,550
2000	4,280	0	4,280	5,260

a/ The TEC and TPC decreased as a result of Savannah River's mission change from a defense production site to an environmental site for cleanup and deactivation. Baseline change proposal 96-D-470/002 documents the change.
b/ Completion date changed from 1st Quarter 1999 to 2nd Quarter 2000 due to a lack of Congressional funding authorization to begin work in FY 1996.

2683

1. Title and Location of Project:	Environmental Monitoring Laboratory, Savannah River, Aiken, South Carolina	2a. Project No.: 96-D-470 2b. Construction Funded	ADS# SR-6985-23

8. Project Description, Justification and Scope

This project will design, build, and equip a new Environmental Monitoring Laboratory (EML) and support facilities at the Savannah River Site (SRS). The new facility will provide continued full compliance with the Occupational Safety and Health Administration (OSHA) and environmental protection requirements as detailed in federal and state regulations and Department of Energy (DOE) Orders. The EML will house the equipment and personnel to support the site environmental sampling, radioanalytical counting, water quality/groundwater assessments, and environmental radiochemistry. The new laboratory and support facilities will include laboratory modules, mechanical and electrical support services, storage space, and offices for technical and administrative personnel. The design of the laboratory will accommodate future growth by providing expansion capability for additional laboratory modules and associated support features.

The laboratory will be a facility of approximately 54,000 square feet and will be divided into two major functional areas: 1) laboratory and 2) office and administration. The laboratory section (approximately 24,000 square feet) includes the sampling rooms, water quality/groundwater laboratory modules, radiochemistry laboratory modules, radioanalytical counting rooms, and storage rooms. In addition, a service basement of approximately 15,000 square feet will be provided to include a boiler room, cylinder storage room, Radiological Buffer Area (RBA) treatment system, laboratory exhausthood duct system, flammable storage room and vehicle circulation space. The office and administration area (approximately 15,000 square feet) includes space for management and staff, data management, publication rooms, and record storage. The facility size is reduced from 78,600 square feet to approximately 54,000 square feet. Facility size reductions were experienced in the administration area, laboratory area, and the service basement.

The support facilities include the HP Complex Wastewater Treatment Facility (approximately 1,800 square feet) and an Acid/Base/Organic Storage Facility (approximately 1,200 square feet). The HP Complex Wastewater Treatment Facility will house the treatment systems required for the EML and the Health Physics Site Support Facility (96-D-473).

The support laboratories operated by the Environmental Monitoring Section (EMS) of the Environmental Protection Department currently occupy facilities which are at the end of their life cycles. General deterioration is evident and catastrophic ventilation system failures have occurred and are expected to become prevalent within the next ten years creating Occupational Safety and Health Administration (OSHA) concerns. In addition, current operations are being performed in facilities that have the following design deficiencies: 1) facilities do not provide neutralization capabilities for acidic waste water; 2) facilities cannot accommodate large amounts of automated instrumentation and computers; 3) facilities do not allow adequate sample segregation. Facility renovation studies were conducted identifying that a significant cost would be experienced to renovate facilities over forty years old. Meanwhile, the EMS mission and regulatory requirements continue to grow.

2684

1. Title and Location of Project:	Environmental Monitoring Laboratory, Savannah River, Aiken, South Carolina	2a. Project No.: 96-D-470 2b. Construction Funded	ADS# SR-6985-23

8. Project Description, Justification of Scope (continued)

This project will provide a facility that will be an essential part of safe operation of the site, and will allow the site to remain in full compliance with Federal and state regulations and DOE Orders 5400.1, General Environmental Protection Program, and 5400.4, Radiation Protection of the Public and the Environment. Environmental Monitoring Laboratory performed environmental analysis in support of the following: Canyon Operations, Reactor and Fuel Basin Storage facilities, Tritium programs, Nuclear Material Stabilization programs, and Defense Waste Processing Facility (DWPF), tank farm operations, Consolidated Incinerator Facility and remediation projects.

The new facility will be a self-supporting facility as part of the Health Protection Complex in B-Area of the SRS. Failure to authorize the project will result in the loss of critical ventilation systems due to continued corrosion and perpetuate overcrowded, inefficient conditions for performing environmental monitoring functions. Successful completion of this project will provide adequate facilities to meet current and future sample analysis determination and personnel space requirements. Existing facility renovation is not practical nor cost effective. Renovation is not a viable option since the special provisions to permit EMS mission support would extend the renovation schedule to as long as ten years with a projected cost of approximately $45,000,000.

The gross annual operating cost for this facility is estimated to be $1,970,000. This includes operations, building maintenance, equipment repair, and utility costs.

FY 1997 funds will be used initiate design.

2685

1. Title and Location of Project:	Environmental Monitoring Laboratory, Savannah River, Aiken, South Carolina	2a. Project No.: 96-D-470 2b. Construction Funded	ADS# SR-6985-23

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and management costs		$ 3,447
1. Engineering design and inspection at approximately 13.4 percent of construction costs (item c) (Design Drawings, and Specifications: $1,802)	$ 2,140	
2. Construction management costs at approximately 3.9 percent of construction costs (item c)	632	
3. Project management at 4.2 percent of construction costs (item c)	675	
b. Land and land rights		0
c. Construction costs		16,003
1. Improvements to land	55	
2. Building modifications	13,256	
3. Other structures	115	
4. Utilities	1,905	
5. Special facilities	672	
d. Standard equipment		1,988
e. Major computer items		4,969
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout and acceptance		207
Subtotal		$ 26,614
h. Contingency at approximately 13.8 percent of above costs		3,666
i. Total line item cost (Section 12.a.1.(a))		$ 30,280
j. Non-Federal contribution		0
Net Federal total estimated cost (TEC)		$ 30,280

The Department of Energy (DOE) February 1996 escalation rates (percent per year) used for this estimate are as follows:

Fiscal Year	1997	1998	1999	2000
Escalation	2.7	2.8	3.0	3.0

The above estimate includes $3,123,000 for escalation. Estimate is based on completed conceptual design.

10. Method of Performance

This project will be managed by the Management and Operating (M&O) contractor. To the maximum extent possible, construction and procurement shall be accomplished by fixed price subcontracts awarded on the basis of competitive bidding.

11. Schedule of Project Funding and Other Related Funding Requirements

3.	Programmatic operating expenses directly related to the facility	0
4.	Capital equipment not related to construction but related to the programmatic effort in the facility	0
5.	GPP or other construction related to programmatic effort in the facility	0
6.	Utility costs	100
7.	Other costs	390
	Total related annual funding	$ 1,970

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding
1. Total facility costs
(a) Line item--Narrative not required.
(b) Expense-funded equipment--None.
(c) Inventories--None.
2. Other project costs
(a) R&D necessary to complete construction--None.
(b) Conceptual design--Includes $855,000 spent to prepare a Functional Design Criteria, scope of work, preliminary drawings, conceptual estimate, conceptual design report, and a Task Order Proposal Request for A/E services.
(c) Decontamination and decommissioning (D&D)--None.
(d) NEPA documentation costs--$90,000 - Includes $40,000 for documentation and $50,000 for site characterization.
(e) Other project related costs--$2,465,000 includes startup, equipment setup/checkout, training, and procedure safety documentation preparation.
(f) Non-Federal contribution--None.

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements (continued)

b. Related annual funding

1. Facility operating costs--$1,230,000 includes salaries, benefits, overhead staffing, janitorial services and supplies.
2. Facility maintenance and repair costs--$250,000 includes repair of equipment, HVAC, etc.
3. Programmatic operating expenses directly related to the facility--No incremental staffing required.
4. Capital equipment cost not related to the programmatic effort--None.
5. GPP or other construction related to the programmatic effort--None.
6. Utility costs--$100,000 includes electric power.
7. Other costs--$390,000 includes HP Complex Wastewater Treatment Facility staffing, equipment repair, and supplies.

DRIVERS

Current legislation bans CFC production by December 1995. Continued CFC use is allowed under strict maintenance and operation regimens. However, the free market pricing mechanisms and DOE policy severely discourage procurement of replacement CFCs. In order to continue operations, the DOE must eventually end its reliance upon CFCs for all cooling applications.

CFC MISSION

Due to the regulatory requirements as well as the related impending CFC shortages, it is imperative that action be taken to preserve EM mission capability by instituting CFC management for conserving this limited resource pending replacement by non-CFCs, to reduce the continued cost of operation through increased energy efficiency, and to protect the environment from further damage. Ultimately, this program will eliminate the use of ozone-depleting CFCs to ensure compliance with the EPA Stratospheric Ozone Protection Amendment of the Clean Air Act.

This project provides for the elimination of the use of ozone depleting CFCs to ensure compliance with the EPA stratospheric ozone protection amendment of the Clean Air Act through construction and/or modifications as site upgrades and replacement, utilities, and minor structures required for activities at the Savannah River Site. A project of this type cannot be fully detailed in advance due to changing mission requirements, unexpected catastrophic equipment failures, environmental compliance schedules, etc. The subprojects identified for this fiscal year are examples of chillers under consideration. This approach is based upon similar endeavors by other federal agencies, such as the General Services Administration. In general, the estimated funding for each location and listed subprojects is preliminary in nature and primarily indicative of the size of the subproject and the relative magnitude of the requirements. It should be noted also that the continuing study of requirements will result in changes in scope of some of the subprojects. Other subprojects will be added with the necessary postponement of some of those now included, dependent upon conditions or situations not now apparent, but principally limited to those conditions stemming from catastrophic equipment failures and environmental compliance requirements.

Refrigerant and cooling requirements are the principal use for ozone-depleting substances (CFCs) at the SRS (with Halon fire suppression and specialized solvent cleaning operations comprising the remaining usage). The program will eliminate the use of CFCs used in refrigeration and cooling in chillers, direct expansion air conditioners, process coolers, and other refrigeration equipment. (Halon and solvent cleaning usage is already being addressed by site waste minimization activities and the use of non-CFC based fire protection methodologies.) Small window and wall slot air conditioners and other equipment with refrigerant charges of 10 pounds or less will be replaced when leaks are detected or at the end of their useful life with new equipment utilizing non-CFC refrigerants, and are not addressed under this program. The ultimate disposal or destruction of CFC refrigerants is not considered as part of this effort.

2691

8. Project Description, Justification and Scope (continued)

The principal CFC refrigerants found on the SRS include R-11, R-12, R-113, R-114, R-502, and R-503. Replacement non-CFC refrigerants/systems are already commercially available, and no development activity is required. However, since some non-CFC refrigerant replacements are generally of a higher toxicity, additional ventilation and monitoring systems may be required for some of the modified systems to comply with industry standards.

Aging control systems may also require upgrade in order to interface with modern replacement systems. Asbestos and other potential contaminants found during equipment replacement/retrofit may require abatement, containment, or remediation. In modifying existing systems, required utilities and distribution connections and demolition and disposal may be necessary for non-salvageable components and systems.

The following legislative actions have been considered in the formulation of the CFC Heating, Ventilation, and Air Conditioning (HVAC) Chiller Retrofit Project:

- Title VI of the Clean Air Act, as amended, which mandates a curtailment of ozone-depleting substance production.
- Title III of the Clean Air Act, as amended, waives the Government's sovereign immunity under Section 302(e) and subjects "...any agency, department, or instrumentality of the United States and any officer, agent, or employee thereof" to the provisions of the Act. The Federal Enforcement provisions outlined in Section 113 include civil and criminal penalties for knowingly violating the provisions.
- The *Refrigerant Recycling Rule* as given in 58 FR 28660 allows a maximum leakage of 15% per annum of a refrigerant system's charge of CFC working fluid.
- Title 40 of the Federal Regulations addresses air pollution in general. The EPA final rule (40 CFR 82, "Production and Consumption Controls," 12/10/93) accelerates the phase-out of Class I substances.
- Executive Order 12856 of 1993 addresses federal compliance with right-to-know laws and pollution prevention requirements, and stipulates 50% reduction in leakage/emission of Emergency Planning and Community Right to Know Act chemicals by December 31, 1991, including some CFCs.
- The National Pollution Prevention Act of 1990.
- Executive Order 12843 addresses procurement policies for ozone-depleting substances.

2692

1. Title and Location of Project:	CFC HVAC/Chiller Retrofit, Savannah River Site, Aiken, South Carolina	2a. Project Number: 96-D-471 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The Chlorofluorocarbon (CFC) HVAC-Chiller Retrofit Project has been planned to provide a consistent prioritization method for the application of scarce capital resources to address the replacement or conversion of equipment reliant upon CFC refrigerants. The project will utilize a consistent strategy for assessment of requirements to maintain credibility, and a funding approach based on technical and budget priorities to systematically reduce risk and insult to the ozone and environment while protecting worker and public safety and maintaining critical program activities.

The subprojects identified in this section (new starts) represent the highest priority efforts given the current equipment conditions, site mission status, environmental and/or regulatory compliance information, etc. However, site requirements, unexpected regulatory or safety driven issues, or equipment failures may result in a re-prioritization of the activities proposed under this project. This re-prioritization may result in subproject(s) being substituted for those identified as New Starts. Subproject additions/substitutions/deletions will be controlled and tracked through the Baseline Change Control (BCC) process. Subproject changes will be discretely identified once approved through BCC.

The following is a brief description and justification for each of the chiller subprojects proposed for FY 1997 funding.

FY 1997 Proposed Projects (New Starts)

Subproject 03: Tritium Area Chilled Water Upgrades, Phase II

TEC	Previous	FY 1997	Construction Start - Completion Dates
$7,697	$ 0	$7,697	2nd. Qtr. FY 1997 - 3rd. Qtr. FY 1998

Retrofit two 658-ton chillers in Bldg. 249-H. Replacement of one 198-ton chiller in Bldg. 238-1H, two 191-ton chillers in Bldg. 234-4H, one 445-ton chiller in Bldg. 234-H, and two 300-ton chillers and one 115-ton chiller in Bldg 234-H. The replacement will be a central chiller plant providing 1350 tons of cooling.

Subproject 04: F-Canyon Chilled Water Upgrades

TEC	Previous	FY 1997	Construction Start - Completion Dates
$658	$ 0	$ 658	4th. Qtr. FY 1997 - 4th. Qtr. FY 1998

1. Title and Location of Project: CFC HVAC/Chiller Retrofit, Savannah River Site, Aiken, South Carolina	2a. Project Number: 96-D-471 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

Replacement of two 850-ton chillers in Bldg. 221-F,. Units 1 and 2.

Subproject 01: 777-10A Chilled Water Upgrades

TEC	Previous	FY 1997	Construction Start - Completion Dates
$486	$ 300	$ 186	1st. Qtr. FY 1997 - 4th Qtr. FY 1997

Replacement/retrofit of one 250-ton chiller in Bldg. 777-10A

FY 1996 Projects (New Starts)

Subproject 01: 777-10A Chilled Water Upgrades

TEC	Previous	FY 1996	Construction Start - Completion Dates
$ 486	$ 0	$ 300	1st. Qtr. FY 1997 - 4th Qtr. FY 1997

Replacement/retrofit of one 250-ton chiller in Bldg. 777-10A

Subproject 02: Tritium Area Chilled Water Upgrades, Phase I

TEC	Previous	FY 1996	Construction Start - Completion Dates
$1,200	$ 0	$1,200	4th Qtr. FY 1996 -3rd. Qtr. FY 1997

Replacement of one 445-ton chiller in Bldg. 234-H which is currently inoperable.

2694

1. Title and Location of Project:	CFC HVAC/Chiller Retrofit, Savannah River Site, Aiken, South Carolina	2a. Project Number: 96-D-471 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

EXECUTION CONSIDERATIONS

The two principal options for addressing existing CFC dependent chiller/HVAC systems are: 1) conversion (retrofits) and 2) replacement.

- Conversion (retrofit) of the equipment to use alternative non-ozone depleting refrigerants such as Hydrochlorofluorocarbon (HCFC) or Hydrofluorocarbon (HFC). Conversion needs to consider the impact on the materials utilized in chiller construction (e.g., corrosive effect of alternative refrigerants upon chiller seals) and the impact on equipment performance.

- Replacement of the equipment with new non-CFC dependent equipment.

8. Project Description, Justification and Scope (continued)

Consideration/evaluation of the conversion versus replacement decision include:

Age of the chillers;
Performance of the existing chillers; Machine capability; Relative efficiency, maintainability, and reliability;
Life cycle cost analyses;
Spare part availability;
Current system capacity margin, and future growth requirements; System impact on the site and facility mission, and mission urgency; and
Accessibility issues and structural modifications that may be necessary to accommodate a replacement.

In summary, as equipment approaches the end of its useful life, replacement may appear to be an obvious choice. However, the decision for replacement will not be made until installation costs have been adequately addressed (i.e., removal of existing equipment, accessibility for the placement of new equipment, equipment tie-in points, and new support equipment). The final decision to convert or replace can only be made following a case-by-case engineering evaluation which considers all of the above factors. Private industry involvement and practices will be employed to the greatest extent possible.

2695

1. Title and Location of Project: CFC HVAC/Chiller Retrofit, Savannah River Site, Aiken, South Carolina

2a. Project Number: 96-D-471
2b. Construction Funded

9. Details of Cost Estimate

This cost estimate is based upon direct field inspection data coupled with parametric cost data and completed conceptual studies and designs when available.

		Item Cost	Total Cost
a.	Design and management costs		$ 3,620
	1. Engineering design and inspection at approximately 7 percent of construction costs (item c)	$ 2,192	
	2. Construction management costs	0	
	3. Project management at 4 percent of construction costs (item c)	1,428	
b.	Land and land rights		0
c.	Construction costs		32,263
	1. Improvements to land	0	
	2. Buildings	0	
	3. Electrical and instrumentation	0	
	4. Other structures	0	
	5. Utilities	0	
	6. Special facilities	32,263	
d.	Standard equipment		0
e.	Major computer items		0
f.	Removal cost less salvage		0
g.	Design and project liaison, testing, checkout and acceptance		0
	Subtotal		$ 35,883
h.	Contingency at approximately 25 percent of above costs		9,117
i.	Total line item cost (Section 12.a.1.(a))		$ 45,000
j.	Non-Federal contribution		0
	Net Federal total estimated cost (TEC)		$ 45,000

The DOE escalation rates (percent per year) used for this estimate are as follows:

Fiscal Year	1996	1997	1998	1999	2000	2001
Escalation	3.2	2.7	2.8	3.0	3.0	3.0

The above estimate includes $2,433,257 for escalation.

1. Title and Location of Project: CFC HVAC/Chiller Retrofit, Savannah River Site, Aiken, South Carolina

2a. Project Number: 96-D-471
2b. Construction Funded

10. Method of Performance

Installation of replacement equipment and system conversions (retrofits) will be performed to the greatest extent feasible through competitive solicitations or competitively selected service contracts. Procurement will be accomplished to the maximum extent practical through competitively bid solicitations and contracts.

11. Schedule of Project Costs and Other Related Cost Requirements

	FY 1996	FY 1997	FY 1998	FY 1999	FY 2000	FY 2001	FY 2002	Total

1. Title and Location of Project: Health Physics Site Support Facility, Savannah River Site, Aiken, South Carolina

2a. Project No.: 96-D-473 ADS# SR-6985-20
2b. Construction Funded

3a. Date A-E Work Initiated (Title I Design Start Scheduled): 2nd Qtr. FY 1997

3b. A-E Work (Titles I & II) Duration: 14 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $27,800
Total Project Cost (TPC) -- $31,500

4a. Date Physical Construction Starts: 3rd Qtr. FY 1998

4b. Date construction ends: 2nd Qtr. FY 2000

6. Current Cost Estimate:
TEC -- $17,200 a/
TPC -- $19,500

7. Financial Schedule (Federal Funds):

Fiscal Year	Appropriations	Adjustments	Obligations	Costs
1997	$ 2,000	$ 0	$ 2,000	$ 1,400
1998	4,000	0	4,000	3,800
1999	10,000	0	10,000	10,800
2000	1,200	0	1,200	1,200

a/ The TEC and TPC have decreased~~, and the construction end date has changed from the 3rd Qtr. FY 2000 to the 2nd Qtr. FY 1999~~, as a result of the Savannah River mission change from a defense production site to a surplus site to be deactivated.

2699

1. Title and Location of Project: Health Physics Site Support Facility, Savannah River Site, Aiken, South Carolina	2a. Project No.: 96-D-473 2b. Construction Funded	ADS# SR-6985-20

8. Project Description, Justification and Scope

This project will design, build, and equip a new Health Physics Site Support Facility at the Savannah River Site (SRS). The new facility will provide for full compliance with radiation protection requirements of the Department of Energy (DOE) Orders. Health Physics Technology laboratory and processing facilities determine, evaluate, and document personnel exposures to radioactive materials. The new laboratory facilities will include laboratory modules for sample receipt, sample preparation, counting for radioactivity, thermoluminescent dosimeter processing, data evaluation, mechanical and electrical support services, storage space, and offices for technical and administrative personnel. The technology center will be a facility of approximately 45,000 square feet and will be divided into two major functional areas: the in-vitro laboratory and dosimetry processing within the office and administration section. The in-vitro laboratory (approximately 15,000 square feet) includes the bioassay laboratories, storage and receiving rooms, and analytical offices. Dosimetry processing, located within the administration areas, houses dosimetry receiving, staging, and processing rooms; record and file storage rooms; and support offices. The office and administration area provides space for management, staff and associated support requirements. The Dosimetry and Administrative areas are approximately 20,000 square feet. In addition, a service basement of approximately 10,000 square feet will be provided below the in-vitro laboratory to house wash-down facilities for the hood exhaust duct and mechanical fans.

FY 1997 funding will be used to initiate design work.

The Health Protection (HP) Department technical support laboratories and offices still occupy essentially the same facilities that were designed and constructed in the early 1950's, with no significant increase in facility floor space. These facilities were originally designed for a limited sampling program for a site population of less than 10,000. With the additional number of site and Health Protection employees, increases in site monitoring requirements, and general deterioration of the current laboratories, the existing facilities can no longer adequately support the health protection needs of the site.

This project will provide a facility that will be an essential part of safe operation of the site, and which will allow the site to be in full compliance with DOE Order 5480.11 (Radiological Protection for Occupational Workers) and DOE Radiological Control Manual DOE/EH-0256T. Health Protection performs bioassary and dosimetry analysis on workers supporting the following: High and Low-Level Waste Operations, Reactor and Fuel Basin Storage, Tritium Programs, and Nuclear Material Stabilization Facilities.

Existing facility renovation or expansion is not practical nor cost effective. Renovation would be ineffective since the existing facilities do not contain sufficient space required to perform the types and quantity of analyses required. Facility expansion is not practical since appropriate space adjacent to the current facility is not available. No other suitable space is currently available onsite. Due to potential site mission changes and population shifts, the availability of existing onsite space will be again reviewed during Title I design.

The gross annual cost for operating this facility is estimated to be approximately $580,000. This includes building maintenance, equipment repair, janitorial services, and utility costs.

1. Title and Location of Project: Health Physics Site Support Facility, Savannah River Site, Aiken, South Carolina

2a. Project No.: 96-D-473
2b. Construction Funded

ADS# SR-6985-20

9. Detail of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 2,680
1. Engineering, Design and Inspection at approximately 6 Percent of Construction Costs, Item c (Design, Drawings, and Specifications $750,000)	$1,280	
2. Construction Management Costs at 3.9 Percent of Construction Costs, Item c	480	
3. Project Management at 7.4 Percent of Construction Costs, Item c	920	
b. Land and Land Rights		0
c. Construction Costs		12,390
1. Improvements to Land	440	
2. Buildings	11,950	
3. Other Structures	0	
4. Utilities	0	
5. Special Facilities	0	
d. Standard Equipment		0
e. Major Computer Items		0
f. Removals Cost Less Salvage		0
g. Design and Project Liaison, Testing, Checkout and Acceptance		$ 15,070
Subtotal		2,130
h. Contingency at Approximately 29 Percent of Above Costs		$ 17,200
i. Total Line Item Cost (Section 12.a.1.(a))		0
j. Non-Federal Contribution		$ 17,200
k. Net Federal Total Estimated Cost (TEC)		

The Department of Energy (DOE) February 1993 escalation rates (% per year) used for this estimate are as follows:

Fiscal Year	1997	1998	1999
Escalation	2.7	2.8	3.0

The above estimate includes $1,205,000 for escalation.

1. Title and Location of Project: Health Physics Site Support Facility, Savannah River Site, Aiken, South Carolina

2a. Project No.: 96-D-473
2b. Construction Funded

ADS# SR-6985-20

10. Method of Performance

Design and inspection will be performed by competitively bid contractor A/E, under the direction of the site Management and Operating (M&O) contractor. Furniture and non-engineered equipment will be procured separate from the building construction activities if available site inventories are inadequate.

Note: The estimate is based on a completed conceptual design.

11. Schedule of Project Funding and Other Related Funding Requirements

	Prior Years	FY 1997	FY 1998	FY 1999	FY 2000	Total

1. Title and Location of Project:	Upgrade Site Road Infrastructure, Savannah River Site, Aiken, South Carolina	2a. Project No.: 95-D-155 2b. Construction Funded	ADS# SR-6085-16

8. Project Description, Justification and Scope

The Upgrade Site Road Infrastructure project provides for replacement of four bridges. The bridge replacement includes the 2-lane bridge on Road F, two 4-lane bridges on Road C, and the clover leaf bridge at Road 2 and Road C.

Bridges 603-2G and 603-3G are constructed on timber piles. Recent inspections show section loss on these piles ranging from 5 percent to 90 percent. The five-year inspection of SRS bridges have identified 603-1G and 603-67G to be in need of immediate replacement. Due to their inability to support designated loads, both of these bridges have been de-rated causing the re-routing and restricting of heavy loads, including; logging trucks, concrete trucks supporting ongoing construction; and the High Activity Waste Trailer that supports the Savannah River Technology Center.Currently, these bridges must be monitored closely during the passage of very heavy loads and must be inspected twice yearly, versus the normal five year cycle, to assess the load carrying capacity and safety. These bridges require replacement in order to safely carry their design loads.

The annual maintenance and repair costs are estimated to be $18,000. This includes cleaning of bridge deck, incidental striping and marking, bridge and road shoulder inspection, and maintenance of bridge bearing assemblies.

FY 1997 funds will be used to continue construction of the bridges.

NOTE: This project transferred to Environmental Management from Defense Programs in FY 1996.

1. Title and Location of Project: Upgrade Site Road Infrastructure, Savannah River Site, Aiken, South Carolina | 2a. Project No.: 95-D-155 | 2b. Construction Funded | ADS# SR-4085-16

9. Detail of Cost Estimate

	Item Cost	Total Cost
a. Design and Management Costs		$ 1,900
1. Engineering, Design and Inspection at approximately 23 Percent of Construction Costs (item c) (Design, Drawings, and Specifications: $520,000)	$ 1,240	
2. Construction Management Costs at 8 Percent of Construction Costs (item c)	420	
3. Project Management at 4 Percent of Construction Costs, (item c)	240	
b. Land and Land Rights		0
c. Construction costs		5,400
1. Improvements to Land	0	
2. Buildings	0	
3. Other Structures (Bridges)	5,400	
4. Utilities	0	
5. Special Facilities	0	
d. Standard Equipment		0
e. Major Computer Items		0
f. Removal Cost Less Salvage		300
g. Design and Project Liaison, Testing, Checkout and Acceptance		0
Subtotal		$ 7,600
h. Contingencies at Approximately 38 Percent of Above Costs		2,900
i. Total Line Item Cost (Section 12.a.1.(a))		$ 10,500
j. Non-Federal Contribution		0
k. Net Federal Total Estimated Cost (TEC)		$ 10,500

Note: The estimate is based on a completed conceptual design.

The Department of Energy (DOE) August 1992 escalation rates (percent per year) used for this estimate are as follows:

Fiscal Year	1995	1996	1997	1998
Escalation	3.5	3.7	3.8	3.8

The above estimate includes $658,000 for escalation.

2707

10. Method of Performance

Title I and Title II design will be performed by the Corps of Engineers or a contractor. Procurement and project management will be performed by Corps of Engineers.

11. Schedule of Project Funding and Other Related Funding Requirements

1999	0	0	0	0

*/This data sheet has been revised in its entirety to reflect the current project scope, schedule and cost estimate reflected in the project Conceptual Design Report dated September 21, 1994. The project data sheet submitted in 1993 was based on preliminary estimates and contained "TBD" regarding funding required for FY 1996 through FY 1997.

1. Title and location of project:	Hazardous Materials Management and Emergency Response Training Center Richland, Washington	2a.	Project No. 95-E-600
		2b.	Construction funded

8. Brief Physical Description, Justification, and Scope

The Hazardous Material Management and Emergency Response (HAMMER) training center for Worker Safety will be a new 80-acre training site for hazardous material workers and emergency responders. The center will house approximately 30 "hands-on" training aids that will simulate hazardous waste management, environmental restoration, fire training, transportation, and emergency response activities. The center will also include an administrative building with classrooms, resource center, and emergency operations training facility; training buildings to house selected training props and services; and other training and support facilities. As cleanup evolves and as new technologies are developed, the HAMMER training center will be versatile enough to meet the changing training needs.

For the next 30 years, the main activities at the Hanford Site will involve the management and cleanup of toxic substances. Thousands of workers involved in these new activities will need systematic training appropriate to their tasks and the associated risks. This project is a very important part of the site mission and will enable the U.S. Department of Energy (DOE) to meet its high standards for safety.

The proposed HAMMER training center will provide a cost-effective, high-quality way to meet the Hanford Site training needs. HAMMER creates a partnership among DOE; its contractors; labor; local, state, and tribal governments; and selected institutions of higher education. Through this partnership, HAMMER will:

1. Host hands-on performance based on health and safety training to save lives and reduce costs.

2. Enhance the skills and knowledge of the environmental clean-up workers and emergency responders.

3. Support the diversification of the regional economy surrounding the Hanford Site.

The annual operating costs of this facility will be approximately $3,530,000 (estimated in FY 1999 dollars).

2712

1. Title and location of project:	Hazardous Materials Management and Emergency Response Training Center Richland, Washington	2a. Project No. 95-E-600
		2b. Construction funded

9. Details of Cost Estimate [b/]		Item Cost	Total Cost
a.	Design and management costs		$ 5,150
	(1) Engineering, design and inspection at approximately 14% of construction costs, Item C	$ 2,780	
	(2) USACE Construction management costs (at 8% of construction costs)	1,540	
	(3) WHC project management (at 4% of construction costs)	830	
b.	Land and land rights	0	
c.	Construction costs		20,060
	(1) Improvements to land	2,440	
	(2) Buildings (86,000 gross sq. ft./$115 per sq ft)	9,900	
	(3) Other structures (including training costs)	0	
	(4) Utilities	5,340	
	(5) Special facilities	2,380	
d.	Standard equipment		570
e.	Major computer items		0
f.	Removal cost less salvage		0
g.	Design and project liaison, testing, checkout, and acceptance		180
	Subtotal		$25,960
h.	Contingencies at approximately 15% of above costs		3,940
i.	Total line-item cost (Section 12.a.(1)(a))		$29,900
j.	Non-Federal contribution		0
h.	Net Federal Total Estimated Cost (TEC)		$29,900

[b/] All costs include escalation based on the Material and Labor Escalation Study, prepared by ICF Kaiser Hanford Company, dated February 1994. Engineering: FY 1995 (4.2%), FY 1996 (4.2%), FY 1997 (4.5%); construction: FY 1995 (3.4%), FY 1997 (3.4%), and FY 1998 (3.7%).

2713

1. Title and location of project:	Hazardous Materials Management and Emergency Response Training Center Richland, Washington	2a. Project No. 95-E-600
		2b. Construction funded

10. Method of Performance

The definitive design and construction engineering/inspection will be performed by a combination of the U.S. Army Corps of Engineers, Walla District (USACE) and an off-site Architect-Engineer contractor. To the maximum extent practicable, construction and procurement will be performed by fixed-price construction awarded on the basis of competitive bidding. The operating contractor will be responsible for overall project management and reporting to DOE.

11. Schedule of Project Funding and Other Related Funding Requirements

2a. Project No.: 94-D-401 ADS# ID-6317-6
2b. Construction Funded

3a. Date A-E Work Initiated, (Title I Design Start Scheduled): 2nd Quarter FY 1994

3b. A-E Work (Titles I and II) Duration: 24 months

5. Previous Cost Estimate:
Total Estimated Cost (TEC) -- $13,430
Total Project Cost (TPC) -- $14,445

4a. Date Physical Construction Starts: 3rd Quarter FY 1995

4b. Date Construction Ends: 1st Quarter FY 1997

6. Current Cost Estimate:
TEC -- $11,430
TPC -- $12,301 a/

7. Financial Schedule (Federal Funds)

Fiscal Year	Appropriation	Adjustments	Obligations	Costs
1994	$ 1,190	$ (600) b/	$ 590	$ 590
1995	5,219	0	5,219	1,438
1996	5,074	0	5,074	7,772
1997	547	0	547	1,630
1998	0	0	0	0

a/ The TPC/TEC reductions are a result of FY 1996 indirect cost reductions associated with the Office of Nuclear Material and Facility Stabilization productivity initiatives, and reduction in workscope with the removal of Argonne National Laboratory - West (ANL-W) fire station design and construction activities.

b/ Adjustment reflects the Conference Mark ($590,000) and the general reduction ($10,000).

2217

1. Title and Location of Project:	Emergency Response Facility, Idaho National Engineering Laboratory, Idaho	2a. Project No.: 94-D-401 2b. Construction Funded

8. Project Description, Justification and Scope

This project provides for the design, procurement, and construction of a new fire station and fire fighter training facility at the Central Facilities Area (CFA) of the Idaho National Engineering Laboratory (INEL). The new fire station at CFA will consist of administrative offices, equipment maintenance areas, equipment storage, dormitory and ready room facilities, and response vehicle bays. The alarm control and response center will remain at the present location and will not be moved in the CFA fire station. The new fire fighter training facility will include a state-of-the-art computer controlled fire simulation facility and several outdoor fire training areas. The new station and training facility will be located adjacent to the CFA to enhance response time for emergency vehicles to the Idaho Chemical Processing Plant (ICPP) and Test Reactor Area (TRA).

This project is required to upgrade fire protection and fire protection personnel training to comply with DOE Orders and National Fire Protection Agency (NFPA) Codes. Without new facilities, the existing station and drill fields will require major additions and renovations to provide additional space and eliminate building deficiencies to meet the minimum regulatory and operational need of the Fire Department. The extent of renovations to correct deficiencies and provide an adequate facility would severely impact the Fire Department operations. The existing fire station at CFA and was constructed in the 1950's. Maintenance and repair costs will escalate as the facility continues to deteriorate with age. Without this project, fire fighter training requirements in accordance with DOE Order 5480.4, "Environmental Protection, Safety, and Health Protection Standards," and NFPA Codes 1001, "Fire Fighter Professional Qualifications," 1002, "Fire Apparatus Driver/Operator Qualifications," and 1003, "Air Port Fire Fighter Professional Qualifications" will not be met. The existing drill field utilizes diesel fuel ignited in open trenches to provide fires for training. Current State of Idaho regulations only allow these exercises to be conducted twice annually. The existing fire training tower has been closed due to OSHA deficiencies. What little training is provided will continue to adversely affect the environment and pose safety hazards to the trainees. Additionally, the Fire Department is currently out of compliance with NFPA 1500, "Fire Department Occupational Safety and Health Program" and NFPA Code 1581, "Fire Department Infectious Disease Control Program." The response team's existing living quarters will not support the additional growth necessary to provide coverage to the expanding activities at the INEL.

The Tiger Team's investigation of the INEL in the summer of 1991 produced findings resulting in two Corrective Action Plans (CAP) that require the construction of this project. Specifically, these CAP's are DOE1/FP6-1.CP01, "Fire Department Staffing and Resource Levels," DOE1/FP6-2.CP01, "Fire Department Facility Compliance."

1. Title and Location of Project:	Emergency Response Facility, Idaho National Engineering Laboratory, Idaho	2a. Project No.: 94-D-401 2b. Construction Funded

8. Project Description, Justification and Scope (continued)

The new fire station will be a single-story, pre-engineered, metal building system. Gabled ridge frames will provide a double-sloped roof with a minimum, inside height clearance of 14 ft at the side walls of the apparatus bays. A mezzanine level will be provided in each structure to house many of the building utility systems, and will be supported with steel columns and beams, utilizing the main structural frame columns to the extent possible.

The CFA Fire Training Facility will provide space for live fire training exercises as well as appropriate facilities for class room instruction. Live fire training will include the one of three computer controlled fire simulators, which are capable of providing various fire classes and catagories. This facility will be constructed with non-combustible materials.

2719

1. Title and Location of Project:	Emergency Response Facility, Idaho National Engineering Laboratory, Idaho	2a. Project No.: 94-D-401 2b. Construction Funded

9. Details of Cost Estimate

	Item Cost	Total Cost
a. Design and management costs		$ 2,598
1. Engineering design and inspection at approximately 15 percent of construction costs (item c)	$ 851	
2. Construction management costs at approximately 22 percent of construction costs (item c)	1,259	
3. Project management at 9 percent of construction costs (item c)	488	
b. Land and land rights		0
c. Construction costs		5,466
1. Improvements to land	598	
2. Buildings	3,731	
3. Other structures	0	
4. Utilities	1,137	
5. Special facilities	0	
d. Standard equipment		89
e. Major computer items		0
f. Removal cost less salvage		0
g. Design and project liaison, testing, checkout, and acceptance		0
Subtotal		$ 8,153
h. Contingency a/ at approximately 40 percent of above costs		3,277
i. Total line item cost (Section 12.a.1.(a))		$ 11,430
j. Non-Federal contribution		0
Net Federal total estimated cost (TEC)		$ 11,430

Note: Project costs are based on 100 percent completed conceptual design.

All costs have been escalated based upon the methodology developed for the Idaho Field Office in conjunction with the economic escalation indexes for Department of Energy construction projects.

a/ A Baseline Change Proposal is currently in process, which will utilize a portion of the contingency.

1. Title and Location of Project:	Emergency Response Facility, Idaho National Engineering Laboratory, Idaho	2a. Project No.: 94-D-401 2b. Construction Funded

10. Method of Performance

The Department of Energy Idaho Office (DOE-ID) shall be responsible for implementation of the project, including selection of principal contractors and approval of specified procurement actions. DOE-ID project management shall be performed by the Construction Management Group, in the Office of Program Execution. Safety, Environmental, and other project support shall be furnished to the project on an as-needed basis by the DOE-ID Matrix Organization.

The operating contractor will be responsible for the development of the project's technical requirements, completion of the Architectural and Engineering Design, review and management of the engineering and construction activities, procurement of selected equipment, checkout of systems, and maintenance of the completed project. Project Management shall be performed by the Facility Engineering Group.

The INEL Construction Manager (CM) shall be responsible for all construction activities at the INEL site, to include constructability review of the design, coordination of long-lead procurement of construction materials and equipment, construction subcontracting, direction of the activities of construction subcontractors, and performance and management of construction activities as required to complete the project in a timely, safe, and cost effective manner.

1. Title and Location of Project:	Emergency Response Facility, Idaho National Engineering Laboratory, Idaho	2a. Project No.: 94-D-401 2b. Construction Funded

12. Narrative Explanation of Total Project Funding and Other Related Funding Requirements

a. Total project funding

1. Total facility costs
   (a) Line item--The cost is based upon the conceptual design that was completed in February 1992. The conceptual design cost estimate was prepared utilizing the INEL Cost Estimating Manual and DOE Order 5700.2C.
   (b) Expense-funded equipment--None.
   (c) Inventories--None.
2. Other project costs
   (a) R&D necessary to complete construction--Narrative not required.
   (b) Conceptual design--The conceptual design cost represents the FY 1992 operating funding which was expended for the preparation of functional and operational requirements, and the conceptual design report (CDR) which includes various engineering studies, a Quality Program Plan, and a Configuration Management Plan. Conceptual design costs also include the cost of performing design reviews of the CDR and incorporation of comments resulting from the review ($283,000).
   (c) Decontamination and decommissioning (D&D)--None.
   (d) NEPA documentation costs--The NEPA documentation is approved as a categorical exclusion at a cost of $5,000.
   (e) Other project related costs--This category includes the costs associated with the preparation of the project management plan, value engineering, relocation of equipment that will serve the same function as in its original location, system operational testing, operational readiness reviews, occupational readiness reviews, and operationally funded configuration management activities for the completed facility ($547,000).
   (f) Non-Federal contribution--None.

b. Related annual funding

Total facility operating costs are based upon FY 1993 Emergency Response Operating Budget for CFA, escalated to date of occupancy of the new facility. Facility maintenance and repair costs estimates are based upon conceptual design indications of routine and preventative maintenance. Utility costs are based upon estimates of utility usage conceptual design information and historical data for similar facilities.

ENVIRONMENTAL RESTORATION

PROGRAM MISSION

The mission of the Environmental Restoration (ER) program is to protect human health and the environment from risks posed by inactive and surplus DOE facilities and contaminated areas, by remediating, decontaminating and dismantling (D&D) sites, facilities and contaminated areas in the most cost-efficient and responsible manner possible in order to provide for future beneficial use. Program responsibilities at these sites include interim/remedial actions, D&D, compliance oversight, surveillance and maintenance, landlord functions and a prudent amount of program management activities. This budget request includes funds to carry out activities that must be undertaken immediately to minimize or prevent significant risk to workers, the public or the environment; activities required by current Federal, State, and local regulatory agreements (in place or in negotiation); and support of other legal requirements, and DOE Orders.

The ER program currently manages activities in three appropriation accounts: EM Defense, EM Non-Defense, and this account, the Uranium Enrichment Decontamination and Decommissioning Fund. In total, the ER program includes over 600 Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA) projects, including 320 projects associated with sites on the Environmental Protection Agency's (EPA) National Priorities List (NPL), 46 Formerly Utilized Sites Remedial Actions Program (FUSRAP) sites and 24 Uranium Mill Tailings Remedial Action (UMTRA) sites, and more than 50 other projects. This budget area includes remediation efforts at three former DOE diffusion plants and the federal government share of cleanup work being carried out by mill site owners as specified in Title X, Subtitle A of the Energy Policy Act of 1992. See the Program Performance Summary later in this budget request for more details.

The ER program faces the following challenges;

- Addressing and minimizing urgent and near-term risk to workers, the public and the environment.
- Maintaining a safe, productive, results oriented program.
- Effectively prioritizing and sequencing work covered by Federal and State agreements to incorporate relative risk.
- Demonstrating substantial progress to stakeholders/taxpayers.
- Maintaining the momentum of the program given the constrained budgetary climate facing all Federal Government programs.

2727

To meet these challenges and fulfill its mission, the ER program has established eight goals. They are listed as follows:

(1) Eliminate, reduce, or contain off-site contamination that may pose an adverse risk to the public and/or environment.
(2) Prevent migration of contaminants through timely identification, reporting, assessment, application of best technologies, and safe storage.
(3) Identify, decontaminate and/or control all sites and facilities formerly used by DOE and its contractors.
(4) Eliminate, reduce, or contain on-site contamination, that in future land use, may pose an adverse risk to the public and/or environment.
(5) Responsibly and cost effectively invest in activities, such as site safety, security, and utilities required to maintain the infrastructure to support the ER mission.
(6) Expeditiously cleanup and release facilities and land for public beneficial use.
(7) Make prudent business decisions, such as, funding activities that support and enhance the effective and efficient achievement of the ER mission.
(8) Increase efforts to identify sources, nature and extent of contamination to allow more accurate determination of relative risk, scope and cost of projects and establish data needs/objectives before characterization to increase the cost effectiveness and efficiency of characterization efforts.

The broad strategy of the ER program is to accelerate remediation completions at small sites, address the highest risks first at large sites, and complete decommissioning. Hence, the ER program has organized its sites and facilities into five categories, based upon site and facility similarities, to implement this strategy. These five categories are: UMTRA and FUSRAP, Other Small Sites, Large Site Decommissioning, and large Site Remediation Actions. The organization in these five categories allows for comparability of like sites and facilities, refinement of program focus and direction, and development of remediation strategies. Remediation efforts at Environmental Restoration sites and facilities, within each category are prioritized and sequenced based upon the eight goals discussed above. The definition and objectives of these categories is contained in the Program Mission statements for Defense and Non-Defense activities. Please refer to those sections for a more detailed description of the five ER categories and the entire ER program.

2728

PROGRAM MISSION - ENVIRONMENTAL RESTORATION - D&D (Continued)

In response to the Department's commitment to improve management practices and to adopt performance based budgeting, the ER program tracks performance measures in four areas: 1) completed characterization/assessments; 2) completed interim and removal actions and expedite response actions; 3) completed remedial actions; and 4) completed final D&D projects. Characterization/Assessments are denoted by a completed key assessment document such as a Record of Decision (ROD), Corrective Measure Study (CMS), Closure Plan, D&D Plan, Proposed Plan, National Environmental Policy Act (NEPA) document, or No Action Decision. Interim and removal actions are any actions resulting in physical cleanup progress, reduction of exposure or contaminants or containment of a source term or any action to restrict access to contaminants. Final remedial actions include RCRA closures, RCRA final corrective measures, CERCLA final remedial actions, and completed underground tank programs. D&D final actions are completed when D&D objectives have been met and a report has been submitted for approval. In addition, the program tracks the status of on-going projects in the four performance areas.

The Environmental Restoration program has aggressively pursued productivity savings and cost efficiency initiatives with the objective to administer a program which delivers the "most bang for the buck." In particular, major efforts have been underway to increase the cost effectiveness and efficiency of characterization/assessment activities. In addition, much focus has been placed on the effective management of Environmental Restoration uncosted carryover balances to both reduce and optimize these balances using sound management practices.

To provide maximum flexibility in addressing remediation efforts, all activities are budgeted under operating expenses and include capital equipment-type and construction-type activities. This is consistent with the manner in which Environmental Restoration activities were budgeted and approved by Congress in previous years. General crosscutting support efforts required for effective management and control of Environmental Restoration activities are also included in this budget.

Specific information relating to program diversity, performance measures, assessment versus cleanup trends and uncosted carryover trends for the Environmental Restoration program are presented in the ER "Defense" Program Mission statement. Please refer to this section for tables which are presented from a "National" Environmental Restoration perspective. That is, they combine and display data for all three appropriation accounts for the purpose of demonstrating how the entire ER program fits together. Specific tables for this appropriation account can be found following the Program Performance Summary introductory paragraph for this section.

URANIUM ENRICHMENT DECONTAMINATION AND DECOMMISSIONING FUND
(Tabular dollars in thousands, narrative in whole dollars)

PROGRAM PERFORMANCE SUMMARY

The Uranium Enrichment Decontamination and Decommissioning (D&D) Fund, established by the Energy Policy Act of 1992, supports D&D, remedial actions, waste management efforts, K-25 landlord requirements, recycling activities, a prudent amount of program management and technical support necessary for effective management, and surveillance and maintenance (S&M) efforts associated with pre-existing conditions at the three gaseous diffusion plants owned by the Department of Energy (DOE) and located at Paducah, Kentucky; Portsmouth, Ohio; and Oak Ridge, Tennessee. As required by the Energy Policy Act of 1992, the Department completed a comprehensive environmental audit at the Paducah and Portsmouth sites prior to the lease of facilities at those sites to the United States Enrichment Corporation on July 1, 1993. The audit documented existing and future liabilities attributable to past practices for which the Department retains remediation responsibility.

The Energy Policy Act authorizes annual deposits into the D&D Fund of up to $480 million adjusted for inflation. Domestic utilities are to be assessed up to $150 million per year (adjusted for inflation) for 15 years based on their purchase of Department-produced separative work units. The remainder of the annual deposit, currently estimated at $330 million (adjusted for inflation) was authorized to come from annual appropriations. This Budget request assumes foreign fee receipts of $45,900,000 will be collected in FY 1997.

The Energy Policy Act (Title X, Subtitle A) also requires the DOE to develop and administer a reimbursement program for active uranium and thorium processing sites defined under Title II of the Uranium Mill Tailings Radiation Control Act (UMTRCA) of 1978 (Title II sites) which sold uranium and thorium to the United States Government. The purpose of this program is to assist Title II site owners by compensating them on a per-ton basis for the restoration costs of only those tailings resulting from sale of materials to the Federal Government. Each site licensee's maximum reimbursement is based on the short tons of dry tailings on the site attributable to sales of nuclear material to the Federal Government. The Energy Policy Act directed that funding for this reimbursement be taken from the Uranium Enrichment D&D Fund.

The technical criteria for reclamation, decommissioning, and decontamination are set by reference to UMTRCA, the requirements of the Nuclear Regulatory Commission (NRC), and the definitions in Title X of the Energy Policy Act. The NRC or the agreement States currently license the mill sites, have authority over the site, and require reclamation and closure to terminate the license. The DOE will not duplicate NRC or agreement State regulation in this area, but will perform an independent analysis to validate the claims made by licensees for reimbursement to ensure that reimbursement funds are properly distributed according to the intent of Title X. The Department promulgated regulations in FY 1994 which set forth the reimbursement claim management program, detailed the technical evaluation standards for reimbursement, and laid out the method for calculation of the cap on reimbursement for individual sites.

PROGRAM PERFORMANCE SUMMARY - ENVIRONMENTAL RESTORATION - D&D (Continued)

The areas of responsibility assigned to DOE under Title X of the Act include development of regulations under which Title II licensees may make claims to the U.S. Government for reimbursement; and review of documentation that established sales of uranium ore to the U.S. Government, including quantities sold and the resulting tailings generated. This determination represents the basis for all claims disbursement to a Title II licensee; review of claimants documentation for reimbursement; and reimbursement of licensees for approved claims.

For additional details on schedules and other site-specific information, please refer to the Operating Expense Site Activity Description Sheet included with this submission.

OAK RIDGE

1. Mission Supporting Goals and Objectives

The ER Program managed through the Oak Ridge Operations Office consists of four sites in three states including K-25 and Oak Ridge Operations Office (Tennessee), Paducah Gaseous Diffusion Plant (Kentucky), and the Portsmouth Gaseous Diffusion Plant (Ohio).

The K-25 site occupies 1,700 acres adjacent to the Clinch River, about 13 miles west of Oak Ridge. It was originally built to enrich uranium hexafluoride for Defense Programs. The majority of the 125 major buildings on the site are now inactive since production ceased in 1985. Only a small portion of K-25 activities are funded under the Defense appropriation. The majority of K-25 funding is requested under the Uranium Enrichment Decontamination and Decommissioning Fund appropriation. The Oak Ridge Operations Office is currently in the process of redirecting environmental management efforts toward privatization and beneficial reuse and recycling of facilities, equipment, and materials. There is an on-going initiative to attract private industry investment in the decommissioning infrastructure necessary to accomplish a cost-effective dismantlement and industrial reuse.

The Paducah Gaseous Diffusion Plant is located on 750 acres, including 74 acres of process buildings, and is approximately 15 miles west of Paducah, Kentucky. The Paducah GDP separates uranium isotopes through gaseous diffusion. The process produces enriched uranium, which is used for nuclear fuel in commercial power plants. Two hundred four potential release sites have been identified, of which 156 are grouped into 28 Waste Area Groupings. Major environmental restoration efforts will focus on contaminated ground water to stop offsite migration of contaminants.

The Portsmouth Gaseous Diffusion Plant is located on 3,700 acres, including 93 acres for the process building, and is approximately 20 miles north of Portsmouth, Ohio. The Portsmouth GDP separates uranium isotopes to produce enriched uranium used for fuel in commercial nuclear power plants and from 1956-1991, the production of highly-enriched uranium for defense purposes. Eighty-seven Solid Waste Management Units have been identified and grouped into four quadrants. Major environmental restoration efforts will focus on the contaminated aquifer beneath the site at Portsmouth.

The Oak Ridge Operations Office manages, coordinates, tracks, and assists in the implementation of the ER program among the various sites. Compliance oversight expenses and prudent amount of program management support is provided to assist in the integration of activities being carried out at the three gaseous diffusion plants. In addition, the Oak Ridge Operations Office manages oversight agreements with the States of Tennessee, Ohio, and Kentucky.

II. Funding Schedule - Oak Ridge (Continued)

Program Activity	FY 1995 Comparable Appropriation	FY 1996 Comparable Appropriation	FY 1997 Request	$ Change	% Change
Remedial Action	$ 182,528	$ 155,818	$ 136,221	$ -19,597	-13

TOTAL, Oak Ridge	$ 259,627	$ 236,807	$ 198,200	$ -38,607	-16

III. Performance Summary

FY 1995 Accomplishments

- Initiated metal recycling program at K-25.
- Completed assessment of Block Casting Area (K-1417) and Sludge Fixation Plant (K-1419); powerhouse Removal Project; completed RCRA Closure of K-1407-B Holding Pond and K-1407-C Retention Basin; and completed pond waste repackaging at K-25.
- Completed construction of Paducah interim actions such as the NW Plume IROD #1 Treatment Facility and North/South Diversion Ditch; completed two Paducah assessments through approval of both the NE Plume and WAG 22 (SWMUs 2 and 3) interim action RODs; continued the WAG 23 assessment through RI approval; completed design of the Paducah landfill; begin construction of waste storage facility Phase I at Paducah.
- Completed three Portsmouth assessments including Quadrant I X-749 Phase I CMS, Quad II X-705A/B Phase I and Quad IV/X-611A Wetlands CMS; completed the Peter Kiewit Landfill Seep Treatment interim action; and completed four remedial actions including the underground/above ground storage tanks, X-344A Closure, X-735 Landfill RCRA Closure, and the X-744 Yard Waste Sorting at Portsmouth.
- Completed Lower Watts Bar Reservoir (LWBR) ROD; submit draft Clinch River RI/FS; initiated LWBR monitoring and assessment program.
- Conducted support activities for legacy waste management at Paducah and Portsmouth including treatment, storage and disposal of waste; and provided guidance and support to the D&D site-wide programs.
- Assessed RCRA vulnerabilities at Paducah D&D facilities; performed D&D facility shutdown and S&M activities at Paducah; and completed cooling tower superstructure demolition at K-25.

2739

III. Performance Summary - Oak Ridge (Continued)

FY 1996 Accomplishments (To Date and Planned)

- Start GDP Small Scale Recycling program demonstration and motor decontamination.
- Complete Phase II construction for K-1070 SW 31 Spring; complete K-1417 and K-1419 RCRA Closures; and complete K-1650 and K-1652 Underground Storage Tank (UST) remedial actions at K-25.
- Complete Ground Water Phase V assessment and continue WAG 23 assessment through Feasibility Study approval; initiate Paducah remedial activities such as the NW Plume Iron Filing Treatability Study, and closure of C-409 and C-400-C RCRA facilities; complete construction of Paducah landfill; and complete construction of Phase I waste storage facility at Paducah.
- Complete X-749/X-120 CMS decision; complete X-701B CMS decision; complete X-705 A&B CMS decision and X-611 CMS decision; complete X-749/X-120 Pilot Ground Water Treatment Unit operational interim action; and complete Portsmouth remedial actions including X-611A Lime Sludge Lagoon, old consent decree closures and Peter Kiewit Landfill.
- Complete Clinch River RI/FS and initiate ROD; and continue LWBR monitoring plan.
- Conduct waste treatment, storage and disposal activities at Paducah and Portsmouth to support D&D and remediation efforts, including legacy waste management; support Federal Facilities Compliance Act requirements for mixed waste management at Portsmouth and Paducah; and provide cross-cutting support for site wide D&D programs including oversight development; continue mixed waste shipments to Envirocare from Portsmouth; continue Portsmouth and Paducah shipments of RCRA waste off-site for recycle and disposal; and cap Old Landfill (Cell 3) at Paducah.
- Perform Paducah D&D facility shutdown and Surveillance and Maintenance (S&M) activities; complete demolition of powerhouse complex at K-25; and complete decommissioning and removal of old cooling tower base and sediments at K-25; and complete removal of uranium deposits from pipes in K-25.
- Complete K-1250-4 bridge repair at K-25; continue to provide landlord activities to maintain infrastructure at K-25.

FY 1997 Planned Accomplishments

- Conduct D&D activities including cooling towers, Beryllium Building, and Uranium Recovery Building at K-25; continue Uranium Deposit Removal Project; conduct S&M activities; and provide landlord activities to maintain infrastructure at K-25. Continue large scale scrap metal recycling and GDP motor reuse programs ..... $ 66,908
- Complete Paducah assessments through development of the NW Plume interim action ROD #2 and initiating development of the WAG 1 and 7 ROD and WAG 23 ROD; begin Paducah WAG 22 (SWMUs 2 and 3) interim action construction; complete Paducah NE Plume interim action construction and remedial actions such as the NW Plume interim action #1; C-409 and C-400-C RCRA Closures; start Paducah assessment field work for WAG 17 and WAG 6; perform S&M activities on Paducah D&D facilities 34,310

ENVIRONMENTAL RESTORATION - D&D (Continued)

III. Performance Summary - Oak Ridge (Continued)

FY 1997 Planned Accomplishments (Continued)

- Continue Portsmouth Quad I X-749/120, Quad II X-701B and X-705 A/B CMIs; conduct Quad I X-231A CMI work plan; continue Quad II 7-unit area; conduct collection and treatment of Ground Water plumes; begin RCRA corrective measures for oil biodegration area TCA Plume; and continue S&M activities at Portsmouth 60,837
- Complete Clinch River ROD; and continue LWBR monitoring 3,410
- Conduct support activities for legacy waste management at Paducah and Portsmouth including treatment, storage and disposal; carryout limited recycling activities related to the three gaseous diffusion plants provide cross-cutting support for Oak Ridge site wide D&D programs including technology integration, ER waste management and Agreements-in-Principle (AIP). 32,735

Total FY 1997, Oak Ridge $198,200

Explanation of Funding Changes FY 1996 to FY 1997:

- Delay of D&D and recycling programs at K-25; elimination of K-1070A Burial Ground RI/FS and Pond Waste Management RCRA activities at K-25. (-$23M).
- Delay in completion of North East and North West Plume construction and operations at Paducah (-$14M).

Major Issues:

- Constrained budget will result in failure to comply with two signed RODs, resulting in fines and penalties.

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope

The Environmental Restoration Major Systems Acquisition (MSA) is the aggregation of those activities required in order for the Department of Energy to satisfy it's goal of a 30-year cleanup of contaminated sites at all of the facilities and areas under its cognizance. This includes those activities necessary to plan, budget and manage all work necessary to meet the goal. Remedial action (RA) and decontamination and decommissioning (D&D) activities are conducted in accordance with State and Federal regulatory requirements and are often governed by chosen plans, consent decrees, and/or Federal Facility Agreements (FFAs), and/or Federal Facility Compliance Agreements.

The facilities managed by Lockheed Martin Energy System, Inc. (LMES), at DOE Oak Ridge Operations Office (ORO), where the ER activities are partially funded by the D&D Fund are: the K-25 Plant, the Portsmouth Gaseous Diffusion Plant (GDP), and the Paducah GDP. In addition, the funding is provided for K-25 Site Landlord, Clinch River/Watts Bar Lake Remedial Investigation, Waste Transportation, Storage and Disposal, and Technical Integration.

RA activities included Remedial Investigations/Feasibility Studies (RI/FSs) of contaminated sites, Resource Conservation and Recovery Act (RCRA) facilities assessments, interim corrective measures, remedial design and construction, and independent verification of the remedial activities.

D&D activities include the D&D of surplus facilities and equipment contaminated by various chemical and radioactive wastes. Pending the final disposition of D&D facilities, the goal of this activity is to initially place the D&D facilities in a state where they are harmless to the general public, or if the units cannot be acceptably decontaminated, to isolate and contain the units in order that the general public is not exposed to them. Surveillance and Maintenance (S&M) of facilities are also considered a part of this program.

Certain ORO facilities have been shutdown and therefore the Environmental Restoration program has accepted management responsibilities for these sites (e.g., K-25). Accompanying this management responsibility is funding responsibility for the maintenance, upgrades, and replacement of those site's infrastructure systems necessary to execute the remediation activities at those sites.

K-25 SITE

RA:
The Oak Ridge K-25 Site was built to supply enriched uranium for nuclear weapons production. The K-25 building was the first diffusion facility for large-scale separation of uranium. In response to the national postwar nuclear emphasis, plant operations were modified to include the production of uranium compatible with reactors used to generate electric power. Because of the declining demand for enriched uranium, the enrichment process was placed on standby in 1985 and shut down in 1987. Sixteen operable units have been identified at the K-25 site and are grouped into three general areas: main, process, and external plant areas.

2745

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

D&D:
The K-25 D&D program includes the S&M and D&D of 82 radioactive and/or hazardous material (HAZMAT) contaminated buildings (69 GDP, 13 centrifuge) for radioactive and/or HAZMAT safety IAW DOE Order for Radioactive Waste Management. The buildings have more than 307 acres of floor space, 5,000 process equipment stages, and many utility, electrical, ventilation, and cooling systems. The GDP buildings contain construction materials, internal fluids, and process auxiliary materials that are hazardous and regulated under current standards. The GDP buildings also hold special nuclear material (SNM), residual radionuclides (primarily uranium), and classified hardware. The GDP D&D program can be categorized into three areas: S&M; safe shutdown activities such as HAZMAT, removal and corrective actions; and decommissioning operations.

Landlord:
The purpose of these activities is to achieve and/or maintain a site infrastructure for environmental restoration and waste management activities to support industrial reuse of the site. This goal will be achieved by the procurement of capital equipment, the construction of new facilities when required, and improving existing facilities through electrical upgrades, asbestos abatements, and similar type projects.

Program Management Support:
This is a separate Summary Subproject for the Program Management activities that support all environmental restoration activities.

GDP S&M:
S&M to keep GDP facilities in a safe condition until decommissioning. S&M includes survey of 21 miles of asbestos insulation; 11,000 surplus polychlorinated biphenyls (PCBs) contaminated gaskets; 204 lubricating systems with 279,000 gallons of surplus oil; 44 process coolant systems with more than 2,000,000 pounds of fluorocarbons; SNM; and the maintenance of roofs and shells to ensure building integrity. Other required services include utilities, electric power, security, fire protection, Non-Destructive Assay (NDA) surveys, Nuclear Materials Control and Accountability support, environmental management, technical services (lab support), Health Physics, and Industrial Hygiene.

GDP Safe Shutdown - Removal of HAZMAT to Minimize Environmental Impact and Health/Safety Risks:
Hazards addressed include removal of asbestos; disposal of 11,000 surplus PCB contaminated electrical components and fluids; 279,000 gallons of surplus oil; 2,000,000 pounds of fluorocarbons; miscellaneous chemicals; uranium deposit removal and NDA surveys; reroofing; barrier plant contamination cleanup; radiation contamination control building upgrades; and OSHA electrical compliance work. Concurrent activities include project management and the inventorying, surplusing, characterization, and disposal of hazardous and surplus material.

2746

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

GDP Decommissioning Operations:
Dispose of process equipment (5,000 stages of equipment, including converters, compressors, motors, valve, piping, etc.) contaminated with uranium, auxiliary equipment (non-PCB electrical equipment, lube oil, coolant systems, etc.), the buildings, and contaminated concrete and soil. This also includes characterization, SNM removal/decontamination, restoration and/or demolition of the 82 D&D facilities. Construction, operation, and D&D of support facilities will occur as needed for high and low assay equipment decontamination; and low-level, mixed, hazardous, and sanitary waste of disposal facilities.

OAK RIDGE RESERVATION

Clinch River/Watts Bar:
The Clinch River/Watts Bar RI is a multiple-facility (Y-12, the Oak Ridge National Laboratory, K-25) and reservation-wide task that addresses the transport of water-borne contaminants beyond the boundary of the Department of Energy ORR; the contamination of water, sediment, and biota in off-site surface-water environments; and the risks to human-health and the environment associated with off-site contamination. This activity includes investigation of the nature and extent of contamination, identification and evaluation of remediation alternatives, implementation of selected remedial actions, and any interim measures determined to be necessary to protect human health and the environment.

Primary areas of investigation include Melton Hill Reservoir, the Clinch River from Melton Hill Dam to its confluence with the Tennessee River, the White Oak Creek Embayment, and the Poplar Creek Reservoir. The system is large, encompassing 140 river miles in length and 44,000 acres in surface area, and is used for municipal water supply, sport fishing, boating, swimming, tourism, and residential development. Contaminants of concern include metals (primarily Hg, Pb, As, Se, and Cr), organic compounds (primarily PCBs, dioxin, and chlordane), and radionuclides (primarily Cs-137, Co-60, H-3, and Sr-90).

PADUCAH GASEOUS DIFFUSION PLANT (PGDP)

RA:
The principal on-site process at PGDP is the separation of uranium isotopes through gaseous diffusion to produce enriched uranium. The site covers 750 acres (including 74 acres of process buildings). An estimated 200 Solid Waste Management Units (SWMUs) have been identified as needing characterization and ground water contamination exists both onsite and offsite. Major known contaminants are technetium-99, trichloroethylene in the ground water, and PCBs. There are two major offsite plumes currently undergoing remedial action under the Comprehensive Environmental Response, Compensation and Liability Act process. Offsite contamination have the highest priority for remediation as evidenced in the FFA. Onsite sources for Paducah currently under negotiation.

The following projects are under $3M: Paducah - Roof on H3 Pad, ER Staging Area, Waterline Extension, ER Trailer/ER Trailer IV, ER Field Laboratory, and Relocation of Shower Trailers and Trailer 2, waste storage facility Phase I construction; and Landfill construction.

2747

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

D&D:
Facilities at Paducah where the D&D program provide facility shut down, vulnerability studies, and S&M includes the C-340 and C-410 Buildings.

Program Management Support:
This is a separate Summary Subproject for the Program Management activities that support the RA D&D, and waste management subprojects across the site.

Waste Management (WM):
The WM Program at Paducah addresses the treatment, storage, and disposal of waste resulting from previous site operations and present day waste management activities. All wastes, including hazardous, nonhazardous, and radioactive are managed under this program. Studies and activities are needed to determine appropriate treatment methods and technologies necessary to treat and dispose of wastes, especially those wastes that are land disposal restricted. These activities are also necessary to meet the requirements of the Federal Facilities Compliance Act and the Toxicity Characteristic Leachate Procedure Federal Facility Compliance Agreement. Specific activities include initiating a project to remove asbestos from nickel ingots, completing the certification process for waste disposal, and compiling and analyzing data for accumulated wastes.

PORTSMOUTH GASEOUS DIFFUSION PLANT (PORTS)

RA:
The principal onsite process at PORTS is the separation of uranium isotopes through gaseous diffusion to produce enriched uranium. The site covers 3,700 acres (including 93 acres of process buildings). An estimated 104 SWMUs have been identified as needing characterization. Ground water contamination, especially trichlorethyle, exists. Contamination plumes have been identified and are currently contained within the on-site boundary. Major known contaminants are trichloroethylene, chromium, uranium, technetium and PCBs.

D&D:
The PORTS D&D program provides collective management of surplus facilities on site which require D&D, prioritizes those areas in terms of health, safety, and environmental concerns, and implements the appropriate level of remedial action, and manages various waste streams generated.

2748

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

Waste Management:
The WM Program at Portsmouth addresses the treatment, storage, and disposal of waste resulting from previous site operations and present day waste management activities. All wastes, including hazardous, nonhazardous, and radioactive are managed under this program. Studies and activities are needed to determine appropriate treatment methods and technologies necessary to treat and dispose of wastes, especially those wastes that are land disposal restricted. These activities are also necessary to meet the requirements of the Federal Facilities Compliance Act. Specific activities include determining the need for a new sanitary landfill, developing and implementing a waste tracking program, packaging and shipping wastes offsite, and sampling wastes to determine appropriate storage and treatment requirements.

Program Management Support:
Activities that support the MSA as a whole and cannot be associated with any particular Summary Subproject are funded in Program Management Support. These include the MSA-wide reporting, baselines and senior management of the DOE Prime Contractor. Also included are special projects that require funding but do not fall within any of the Summary Subprojects.

ER Waste Management Treatment/Storage/Disposal (TSD):
TSD activities are necessary to provide capacity for Environmental Restoration Waste Generation. These activities include design, construction, and operations for on-site facilities and funding for commercial TSD activities. LMES support functions include program management, training, systems and planning, and waste minimization. These activities include all waste streams (including D&D wastes) that cannot be treated or disposed of within the area of contamination at all sites. The ER waste management technical scope also involves TSD facilities/activities to provide capacity for ER waste generation which has been left untreated in storage or cannot be provided final disposition during remediation.

Construction Type Facilities:
This program is required to construct certain facilities/systems to carry out its mission. The following are those subprojects that are not remediation related but are still necessary to perform the program mission.

Surveillance and Monitoring:
This activity consists of post-closure inspection and maintenance, and operation and maintenance of facilities built in support of closure and Integrated Resource Management System Activities.

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

K-25 Electrical Utility Upgrades (Construction):
The conversion of the ungrounded 2,400 volt system to a grounded 13.8 kilo-volt system will eliminate personnel safety concerns by providing circuit isolation for single phase to ground faults. The primary supply for the overhead distribution system will be relocated in an effort to consolidate the power distribution.

K-730 Substation:
The existing 45 year old K-731/K-732 switchyard and support facility is the sole source of power for the entire K-25 site and is obsolete and has surpassed its useful life. Construction of the new K-730 Substation will assure that a continued reliable source of electrical power is maintained.

Section A and B:
Repairs to the K-1401 roof, Section A and B, at K-25 are needed to provide safe working conditions, to protect the equipment/facilities inside, and to properly maintain the building itself.

PGDP Waste Storage Phase I:
Funding before FY 1994 was provided by Uranium Enrichment appropriation. 42,000 square feet facility for the storage of liquid and solid RCRA, PCB-contaminated, low-level radioactive, and mixed wastes. The facility will include storage, weighing, sampling, and staging areas.

PGDP Subcontractor Staging Area:
Funding before FY 1994 was provided by Uranium Enrichment appropriation. The construction of four pre-engineered metal buildings and four office trailers for equipment decontamination, showers and toilets, inspections, offices, security, etc.

Off-Site Decontamination Pad:
Funding before FY 1994 was provided by Uranium Enrichment appropriation. The construction of decontamination building and storage building with access and service driveways and perimeter fencing.

PORTS Ground Water Pump and Treatment Facility:
The X-623 Ground Water Pump and Treatment Facility was constructed as part of the X-701B Closure Project. The system consists of three extraction wells around the X-701B Ponds and a facility to pump and treat the ground water to remove Volatile Organic Compounds. The facility can also accommodate tanker trucks with water to be treated.

2750

1. Title and location of project:	Uranium Enrichment D&D Fund Various Locations	2a. Project No. U-1.4.19 2b. Operating Expense Funded

8. Project Description, Justification and Scope (continued)

The Uranium Enrichment Decontamination and Decommissioning (D&D) Fund established by the Energy Policy Act of 1992 will support D&D, RAs, and S&M activities associated with pre-existing conditions at DOE-owned Gaseous Diffusion sites, including those leased and operated by the newly-established United States Enrichment Corporation. The act requires that the Department determine all existing and future liabilities attributable to past practices at these sites by way of a comprehensive environmental audit. The audit was completed in June 1993. The Department retains remediation responsibility for all pre-existing conditions before July 1, 1993. The purpose of the Environmental Restoration Program is to remediate, decontaminate, and dismantle those DOE sites/facilities in compliance with applicable local, State, and Federal regulations within the DOE's 30-year timetable for completion at the gaseous diffusion plants. Legal requirements include those of the Atomic Energy Act, other Federal and State statutes and regulations, and DOE Orders, as well as consent decrees and court orders. The primary Federal regulations that drive the Environmental Restoration are CERCLA, as amended by the Superfund Amendments and Reauthorization Act of 1986, (the Oak Ridge Reservation is on the Environmental Protection Agency's National Priorities List), and RCRA. The construction type facilities listed above are necessary to support the remedial actions.

9. Method of Performance

Remedial Actions:

Remedial action alternative assessments will be performed by LMES personnel and subcontractors to LMES. Preparation of feasibility studies, RA plans, records of decisions, National Environmental Policy Act (NEPA) documentation, RA design and construction will be performed by DOE prime technical support contractors. LMES is the integrating contractor.

D&D:
Planning, preparation of feasibility studies, and NEPA documentation will be performed primarily by subcontractors to LMES.

S&M:
Activities consist of multi-disciplinary efforts coordinated by LMES and its subcontractors. These activities include periodic site inspections, maintenance of physical structures and containment systems, and radiological surveillance. Construction and procurement will be accomplished utilizing fixed-price subcontract awarded on the basis of competitive bidding, where it is in the best interest of the Government.

PROPOSED APPROPRIATION LANGUAGE

For necessary expenses of the Federal Energy Regulatory Commission to carry out the provisions of the Department of Energy Organization Act (42 U.S.C. 7101, et seq.), including services as authorized by 5 U.S.C. 3109, including the hire of passenger motor vehicles; official reception and representation expenses (not to exceed $3,000); [$131,290,000] $159,397,000 to remain available until expended: *Provided*, That notwithstanding any other provision of law, not to exceed [$131,290,000] $159,397,000 of revenues from fees and annual charges, and other services and collections in fiscal year [1996] 1997, shall be retained and used for necessary expenses in this account, and shall remain available until expended: *Provided further*, That the sum herein appropriated from the General Fund shall be reduced as revenues are received during fiscal year [1996] 1997, so as to result in a final fiscal year [1996] 1997 appropriation from the General Fund estimated at not more than $0.

NOTE:

This budget request reflects a FY 1996 appropriation of $131,290,000. Our operating requirement for that year is $159,514,000. We plan to meet this need by using $28,224,000 of prior year (PY) unobligated budget authority. In FY 1997, we intend to use the remaining $5,000,000 of PY unobligated budget authority to reduce our appropriation request from $164,397,000 to $159,397,000.

INTRODUCTION

Total Budget Request
$159.4 Million
1,463 FTEs

The Federal Energy Regulatory Commission (Commission) oversees key parts of the United States' energy industries — electric power, hydropower, and natural gas and oil pipelines. While the Commission's goals endure — protecting the public and the environment by ensuring that the activities of our regulated entities serve the public interest as required by law — the means by which we achieve these goals are changing. As the companies we regulate continue their evolution to a more competitive environment, we continue to refine our regulatory models and develop new ones that recognize the realities of the 1990s: more competition, more consciousness of environmental issues, and a world of commerce that moves much faster.

The Commission's total funding requirement for fiscal year (FY) 1997 is $164,397,000. However, we plan to apply $5,000,000 in unobligated budget authority available from prior years, thereby reducing our request to $159,397,000. The total funding will support a staffing level of 1,463 full-time equivalents (FTEs), an increase of 10 from the FY 1996 level of 1,453.

We will recover the full cost of our operations through a system of annual charges and fees. The revenue collected will be deposited in the Treasury as a direct offset to our appropriation and result in a net appropriation of $0.

Changing Priorities

This budget request reflects the Commission's changing regulatory priorities resulting from two factors: (1) the need to respond to fundamental changes in the electric power industry as we foster a more competitive industry and begin to deal with restructuring and open-access issues; and (2) the successful implementation of Order No. 636, which restructured the natural gas pipeline industry, and ongoing transition as competitive markets mature.

The Commission is transforming federal regulation of energy industries. Through a series of complex and controversial initiatives, the Commission has radically altered and streamlined regulation of the natural gas pipeline industry. As a result, market forces, not regulation, govern the price of natural gas as a commodity. Today these programs enjoy broad-based support.

The Commission has now begun to apply these same competitive market principles to the wholesale electric utility industry. This will be an enormously complex undertaking. It will

require the Commission to fashion open-access tariffs for every transmission-owning public utility in the country to permit expanded marketing of competitively priced power.

This initiative will require a concentration of highly specialized staff resources. Based on our experience with the natural gas industry, we are confident that the result will be increased competition, consumer benefits, a strengthened electricity industry, and — in the long term — a significantly different role for federal regulators in power markets.

Increased Focus on Electric Power

The Commission's role in the next few years will be to shepherd the electric utility industry through a transition to more fully competitive wholesale generation markets. The result will provide major benefits to consumers in the form of lower prices for electricity.

In the wake of the Energy Policy Act of 1992 (EPAct), the Commission has launched a series of initiatives to establish the foundations of a competitive electric industry. The centerpiece of these efforts is the proposed open-access rulemaking that would require utilities to provide open access to the Nation's interstate transmission network. Under the Commission's proposal:

- every public utility under the Commission's jurisdiction must file nondiscriminatory open-access tariffs, making their transmission systems available to all wholesale sellers and buyers of electric power, including their own wholesale customers and competitors;
- the utilities would also be required to take service under these same tariffs to ensure that they treated themselves comparably; and
- the utilities would be allowed the opportunity to recover any stranded costs.

The new rule will have major consumer benefits. A preliminary economic analysis of the impact of the rule contained in the Commission's draft environmental impact statement concludes it will save consumers between $3.75 and $5.5 billion annually.

The new rule (described in greater detail in the following chapter, Electric Power) will facilitate the development of a competitive electric power market by ensuring that wholesale buyers and sellers can reach each other through monopoly-owned transmission systems. The proposed rule is designed to eliminate anticompetitive and discriminatory practices in transmission services and to increase consumer benefits by fostering a competitive wholesale bulk power market for electricity.

The open-access rulemaking will require an enormous Commission effort. Virtually every segment of the electric utility industry — utilities, their customers, independent power producers, municipalities, rural electric cooperatives — as well as state and federal agencies, large industrial customers and financial organizations, have important issues at stake in this proceeding. In view of

the rulemaking's impacts on the industry, the Commission is preparing an environmental impact statement. In addition, to fully consider the important issues involved in moving to competitive markets, the Commission has opened related policy initiatives involving power pools, information systems, independent system operators, merger initiatives, and transmission pricing. The result, with anticipated action on final open-access, stranded-cost, and electronic information systems rules in the spring of 1996, will require a huge implementation effort and transition workload. As an example of the potential workload, the Commission issued over 12,000 pages of orders implementing the Order No. 636 program.

Once the final rule is issued, new or revised transmission tariffs will be required to be filed by the more than 150 interstate transmission-service public utilities under the Commission's jurisdiction. These tariffs, which by their very nature are complex, will likely engender public hearings before the Commission to ensure that their terms and rates are just and reasonable. Filings to recover stranded costs will come thereafter, and will raise their own set of complex, case-specific issues.

These initiatives will result in major consumer benefits that more than justify the minimal staff increase requested for FY 1997 to bring these benefits to fruition.

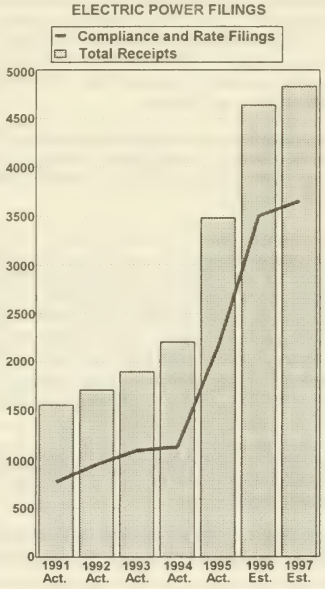
Resource Shifts

Even with the minimal staff increase being sought in this budget, achieving the changes described above will require a major shift in resources, with significantly less staffing and funding budgeted for the natural gas and oil pipeline program and an increase budgeted for electric power regulation. Resources for the hydropower program will remain relatively stable, with only a slight decline from the FY 1995 level.

All of the staffing decreases in the natural gas program and the minimal decrease in the hydropower program will be reallocated to the electric power program, where workload is burgeoning and which will require significant additional resources as we move toward open transmission access and increased competition. Some shifts took place in FY 1995 as staffing decreased in the natural gas area and increased in the electric power program. Further staffing changes will occur in FY 1996 and FY 1997. We are making use of internal staff transfers as much as possible.

Decreases in the Natural Gas and Oil Pipelines Program. The resource shifts respond to the directive of the Congress as expressed in the Conference Committee report accompanying the FY 1996 energy and water development appropriations bill, later enacted into law. In accordance with language in the report, the Commission is reducing staffing in the natural gas and oil pipelines program area to 533 FTEs by FY 1997, a 20% reduction from the FY 1995 authorized level of 666. An interim reduction to 585 is projected for FY 1996. Decreases in program funding in line with the staffing reductions are also planned for FY 1996 and FY 1997.

The Commission is facing a variety of new regulatory challenges as competitive natural gas markets mature. Successful implementation of Order No. 636 has led to many novel regulatory issues. Pipelines are designing new services, proposing novel rate approaches, and seeking new markets. These efforts result in new tariff filings with an accompanying request that the Commission respond quickly so the new, competitive business opportunity will not be lost due to regulatory delay. Local distribution companies are shedding pipeline capacity to lower operating costs and increasingly depend on short-term contracts and spot markets. Producers and other consumers depend on the Commission to ensure pipelines cannot exercise monopoly power in this new marketplace. The Commission has a vital role to play in this new marketplace. We have absorbed the 20% program cut. Further reductions would endanger our ability to respond to the industry's needs in a timely fashion. The new workload resulting from the restructured industry requires the resource levels reflected in this budget, which will allow us to maintain the efficiencies gained by the industry as a result of Order No. 636.



Increase to the Electric Power Program. Prior to FY 1995, we met all of the requirements of the EPAct without any additional funding or FTEs in the electric power program. Beginning in FY 1995, the program requirements simply exceeded our ability to continue without additional resources. In FY 1996 and FY 1997, we plan to meet the unprecedented workload demands by reallocating to the electric power program all of the staffing decreases from the natural gas program, along with the small decrease in the hydropower program. Further, this budget request includes an additional 10 FTEs for the electric power program to meet the burgeoning workload requirements as we implement wholesale open transmission access and move toward increased competition in the electric industry.

To illustrate the extent of the workload explosion: In FY 1995, total receipts in the electric power program had more than

doubled since FY 1991 (nearly 3,500 compared to 1,550), and are expected to triple by FY 1997 (to 4,830). Compliance and rate filings in FY 1995 were almost three times the number received in FY 1991 (2,165 compared to 770); and as early as FY 1996 are expected to more than quadruple (to 3,500). The unprecedented increases, coupled with the initiative to restructure the electric industry, require the increased level of resources for the electric power program reflected in this budget request.

Promoting Competition

Competition offers the best consumer protection from excessive rates. The Commission's strategy for electric power and natural gas and oil pipelines is to encourage market forces as much as possible. The transition to a competitive electric generation sector is underway. We have initiated inquiries into alternatives to cost-based ratemaking for natural gas pipelines, and have approved the use of market-based rates for gas storage facilities where lack of market power has been clearly shown. We have also authorized market-based rates in selected markets of two oil pipelines and have other proposals under review. We also certificate new natural gas pipeline facilities so that new natural gas supplies can serve new markets.

The experience of the past decade is that competition in these sectors can benefit energy consumers all over the country. In constant dollars, natural gas prices are lower, not higher, than they were 15 years ago. And customers have literally hundreds of services available to them that were not available just a few years ago.

Competition in one sector of a regulated industry presents a special challenge to regulators. The fact that gas production or electric generation can be competitive does not mean other sectors of these industries are also competitive. Both electric transmission and mainline gas transmission retain substantial aspects of monopoly power, regardless of competition in generation or production. That monopoly power can translate into market power to block competition in generation or production. The public needs some form of regulatory protection to guard against abuses of market power in these sectors. However, many traditional regulatory approaches are outdated. In some cases, they simply do not work in a world of competitive generation. In others, they hinder the growth of needed market mechanisms. The key to effective competition in both natural gas and electricity is continued regulation of the bottleneck monopolies.

The Commission's goal is to find ways to regulate electric utilities and natural gas and oil pipelines effectively in order to protect ratepayers while working with, rather than against, competitive commodity markets.

Electric Power. In the next few years the Commission will guide the industry through a transition to more fully competitive wholesale generation markets. The Nation endorsed greater competition

in wholesale electric markets with passage of the EPAct, and the Commission is aggressively pursuing its new responsibilities under the Act.

New policy initiatives are responding to, as well as setting in motion, revolutionary change in the electric power industry. Central to our new electric regulation is comparable (nondiscriminatory) open-access transmission, which will let all potential wholesale sellers and buyers use the transmission grid in the same way. That is the best way to encourage the continued growth of a fully competitive wholesale market for generation. On March 29, 1995, the Commission issued a proposed rule that would require all transmission-owning public utilities to provide comparable open-access transmission services.

The Commission is working to address other key issues related to the move to competitive markets. These include:

- stranded costs;
- transmission pricing;
- alternative power pooling institutions;
- regional transmission groups;
- electronic information networks; and
- utility merger policy.

This workload will include processing more new tariffs than we have ever dealt with before. New or revised tariffs will be required for more than 150 transmission service providers. We recognize many open-access tariff proposals will involve special considerations that are unique to a utility's system and may require full evidentiary hearings. Our responsibilities under EPAct and increasing competitive pressures in the industry are expanding, not reducing, our "traditional" workload.

The Commission is aware that legislation has been introduced to repeal the Public Utility Holding Company Act (PUHCA). If enacted, certain consumer protection authority and responsibilities would likely be transferred to the Commission from the Securities and Exchange Commission (SEC). The Commission could become responsible for auditing the books and records of non-utility members of registered holding companies to ensure that deregulated business activities are not subsidized by ratepayers. The Commission would need additional resources to meet these important new responsibilities. Because the legislation has not yet been enacted, we have not included any resources in this budget related to this possible need.

Natural Gas. Consumers need the best protection possible to assure just and reasonable rates, as mandated under the Natural Gas Act. We believe the best means for achieving this goal is to give

consumers access to competitive supplies and transportation whenever possible, while continuing to guard against possible abuses of market power where there can be little or no competition. Now that the industry has been operating under full implementation of Order No. 636 for several years, together the Commission and the industry need to develop approaches to ratemaking and new services that meet the needs of the new industry structure and competitive realities.

New policy initiatives are being crafted in response to the challenges of an evolving competitive gas industry. This will give customers greater reliability, competitive prices, and more valuable services tailored to their individual needs. Finding a way to protect customers in an increasingly dynamic market is the essence of the Commission's work for the foreseeable future. During the next few years we will see changes in these key areas:

- handling more complex natural gas pipeline rate filings;
- analyzing an array of new services and determining what aspects of these services must be regulated;
- setting pipeline rates while considering potentially competitive transportation services;
- encouraging further market development; and
- integrating new construction into the growing national gas market.

We have updated our rate filing and reporting requirements to reflect natural gas pipeline operations in the post-Order No. 636 environment. These revisions balance the need to reduce industry burdens with the need to expedite rate case processing, while still ensuring just and reasonable pipeline rates. The number of traditional rate cases is increasing, as pipelines file to change services and operations to fit the new operating environment and to meet individual customer needs. We anticipate dealing with many unique, complex issues that will need detailed analysis, but have no established precedent. Further, we will have to deal with these issues not only on an individual pipeline basis, but also on an industry-wide basis, as pipelines compete for business.

In FY 1995 we began an inquiry into possible alternatives to cost-of-service ratemaking by issuing a staff white paper for comment. After review of the comments, the Commission issued a policy statement. This policy statement establishes the criteria the Commission will use in evaluating market power of gas pipelines in determining whether to allow market-based rates. It also establishes criteria for evaluating incentive rate proposals. In addition, the Commission determined it would permit the pipelines additional ratemaking flexibility to deal with the changing capacity needs of their customers. In this regard, the Commission authorized pipelines to negotiate individual rate proposals with their customers as long as a traditional cost of service rate is available as a recourse rate.

We hope to provide incentives for efficient operation of monopoly transportation facilities, and to encourage greater throughput through existing facilities, while still meeting our consumer protection

mandate. Where competition exists for gas pipelines, we have authorized a substantial number of proposals for market-based storage rates. And we are exploring alternatives to cost-based ratemaking for other transportation services.

We will meet more challenges as we encourage further market development. As contracts expire, we anticipate capacity holders will reassess the level of firm capacity they need to hold on any pipeline in light of the options now available, such as released and interruptible capacity. Dealing with freed capacity will pose challenges for pipelines, their customers, and the Commission. Through policy statements, such as our recently issued pricing policy for new and existing pipeline construction, we are attempting to reduce uncertainty for pipelines and their customers. Through this new pricing policy, we are seeking to balance the need to encourage new construction and expand markets with the need to protect existing customers.

Oil Pipelines. For oil pipelines, we have implemented the revised regulatory scheme mandated by the EPAct by establishing a simplified method of ratemaking in the form of indexing rates. This method is available for pipelines that do not wish to establish cost-of-service rates or to make a showing of lack of market power that would permit market-based rates.

Making Regulation Work Better

We are committed to a long-term strategy of improving the quality and efficiency of regulation. To do this, we will be more productive and lessen the burden placed on the industries. We expect to achieve these goals by:

- increasing the use of electronic filing and bulletin boards;
- increasing the use of alternative dispute resolution (ADR) techniques;
- improving environmental programs;
- shifting emphasis away from traditional routine casework; and
- supporting the National Performance Review policies.

Electronic Filing and Bulletin Boards. The Commission plans to continue to reduce the industries' paperwork. Electronic filing is already in place for many purposes and will be expanded further. As part of our building consolidation, we developed an electronic infrastructure that encourages more electronic filing and enhances our ability to work directly with electronically filed documents. This will save the industries we regulate money in making their filings and will improve the Commission's work because accessing information will be much easier and faster.

The availability of information is a key element in moving from regulated to competitive markets. In FY 1995 we established the FERC Form No. 1 Forum and Gas Pipeline Data bulletin boards to

disseminate some of the electronic data we collect in a more timely and efficient basis. The bulletin boards provide free access to significant amounts of electric utility and gas pipeline industry data to any person with a computer and modem. Computer systems also provide access to Commission documents and provide users with information on how to obtain some Commission services. We will continue to expand the information available electronically in the coming years.

Alternative Dispute Resolution (ADR). The Commission adheres to the principles of the two major Congressional ADR initiatives, the Administrative Dispute Resolution Act of 1990 and the Negotiated Rulemaking Act.

The Commission remains a pioneer in the area of developing alternatives to lengthy, costly formal hearings. In addition to settling about three-fourths of the public utility and gas and oil pipeline rate cases through negotiation, the Commission has used settlement judges and mediators in its casework. The Commission also adopted ADR procedures for oil pipelines as part of its implementation of the EPAct. These procedures have allowed cases to be resolved in months rather than years. Additionally, the Commission issued a final rule on April 12, 1995, implementing ADR procedures in all of the Commission's program areas.

Recently, the Commission has encouraged the growth of regional transmission groups (RTGs) in electric power. These organizations — composed of all stakeholders: utilities, their customers, independent power producers, and state regulators — promise to provide fair ways to handle many disputes that would otherwise come to the Commission for decision. Setting up and abiding by ADR mechanisms is one of the key aspects of a well-functioning RTG.

This same attention to streamlining dispute resolution applies to environmental areas. For both hydropower licensing and natural gas pipelines, we use prefiling meetings to identify potential areas of conflict early in the review process. Later, we use technical conferences and local public meetings to promote understanding and compromise among the parties.

Recently, the Commission has obtained the assistance of the Federal Mediation and Conciliation Service to facilitate a negotiated settlement of one particularly controversial hydroelectric case. The Commission will use this experience as a model for encouraging future efforts to resolve complex cases through facilitated ADR.

Environmental Programs. Environmental protection remains an important part of the Commission's statutory work. To meet the challenge of increasingly contentious environmental issues, we are improving our environmental programs by:

- balancing the Nation's growing energy needs with the public's growing concern for the environment;

- cooperating with other federal and state agencies to save time and money and arrive at better decisions; and

- monitoring to ensure that the industries are complying with environmental conditions to protect the environment and private property.

Shifting Emphasis. Increasingly, the Commission's approach to regulation is to monitor the industries it regulates, and to act only when there is a clear need to do so. Monitoring allows us to:

- reduce the number of contested issues in cases and limit the number of litigated cases brought before the Commission;

- lower the costs to industry;

- enhance the value of the Commission's work;

- concentrate in other areas that need attention, such as the changing conditions in the electric and natural gas areas; and

- ensure that industries are complying with imposed conditions, such as continued high levels of dam safety.

National Performance Review Streamlining. The Commission fully supports the Administration's and Congress' effort to reduce the size and costs of the federal government. While this budget reflects a modest increase in staffing and funding levels, that increase is attributable to additional workload resulting from EPAct. We have carefully tailored this increase to take full advantage of realized savings in our programs and to meet what we believe will be a truly extraordinary new workload. We face the challenge of meeting new program requirements in the electric power program. We intend to implement an entire new, nationwide open-access transmission regime with minimal new staff resources; we are requesting only 10 new FTEs in this budget, to be devoted to the electric power program.

We plan to meet NPR-targeted levels by reducing certain administrative and support staff. Improved technical and administrative processes now available and under development should help us achieve this goal — for example:

- the installation of the Commission-wide LAN computer system that enhances our ability to communicate with each other;

- the development of computer-based systems that enable companies to submit information electronically; and

- the expansion of electronic filing and electronic bulletin boards that ease the burden on industry and result in significant savings in time and money.

Conclusion

This budget request for 1,463 FTEs and $159,397,000 in new budget authority, along with the use of $5,000,000 in prior-year unexpended budget authority, will provide the level of resources necessary to carry out the full and varied range of our statutory responsibilities. Total planned spending for FY 1997 is only 3.1% over total planned expenditures for FY 1996, even though this budget request includes mandatory increases for the general pay raise and the locality pay adjustment.

Prior to FY 1996, we absorbed the large increases in our electric workload resulting from the EPAct without any new funding or new FTEs. We found, however, that beginning in FY 1995, we could no longer continue that practice, as the mounting workload requirements simply exceeded our capacity to keep pace. As a result, this budget reflects increased resource levels for the electric power program beginning in FY 1996 and continuing into FY 1997. To the extent possible, we will continue to shift staff internally from the natural gas program to cover most of the increased staffing needs. Where necessary, we will hire new staff for specialized occupational skills. This budget will support 10 additional FTEs, which are designated for the electric power program.

The budget also addresses the Congress' direction to reduce staffing by 20% in the natural gas and oil pipelines program by the end of FY 1997. We will manage this by reducing staff in this program in FY 1996 and again in FY 1997 without undue jeopardy to the primary functions and objectives of the natural gas and oil pipeline program. However, even with anticipated gains in efficiency in workload processing and adjustments to staff and workload assignments, these reductions will have an impact on the Commission's ability to process all of the natural gas and oil workload. The anticipated result is that pending workload will increase in some areas as we give priority to cases having statutorily imposed deadlines.

While total resource levels remain about the same in the hydropower program, we are shifting people within the program from the licensing and relicensing function to the compliance and dam safety functions to meet the increased workload in those areas anticipated because of the large number of recently issued relicenses.

RESOURCES SUMMARY
($ in Thousands)

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Request
Program			
Electric Power	$38,088	$42,858	$51,162
Hydropower	56,949	52,300	53,429
Natural Gas and Oil Pipelines	68,554	64,356	59,806
Total Operating Expenses	$163,591	$159,514	$164,397
Application of Prior-Year Budget Authority		(28,224)	(5,000)
Budget Authority/Offsetting Receipts	163,591	131,290	159,397
Net Expenses	$0	$0	$0

FULL-TIME EQUIVALENTS (FTEs)

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Request
Program			
Electric Power	346	414	486
Hydropower	455	454	444
Natural Gas and Oil Pipelines	609	585	533
Total FTEs	1,410	1,453	1,463

NOTE: As directed by the Congress, the Commission is reducing staffing in the natural gas and oil pipelines program to 533 FTEs by FY 1997, a 20% reduction from the FY 1995 authorized level of 666. The FY 1995 actual level shown above reflects the progress we have made thus far.

SUMMARY OF TOTAL WORKLOAD

Receipts

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Electric Power[1]	3,477	4,636	4,830
Hydropower	6,408	6,225	6,310

Overview

The changes taking place in the electric industry today are nothing short of revolutionary. During the next few years, the Commission's role will be to guide the industry through the transition to a fully competitive market for wholesale generation. But, as we learned from our experience in the natural gas industry, transitions must be carefully managed to ensure that they are successful and to assure that competition is working. The key to making competition work in the electric industry is access to the electric transmission grid controlled by the public utilities subject to our jurisdiction.

Since the passage of the Energy Policy Act of 1992 (EPAct), the Commission has been aggressively pursuing policies intended to foster open-access transmission and the development of a fully competitive bulk power market for electricity. EPAct granted the Commission significant new authority to compel public utilities to provide transmission service. In addition, the Commission has been reexamining its existing authority under the Federal Power Act (FPA) to remedy claims of undue discrimination. In a series of orders issued in FY 1994, the Commission found that it was unduly discriminatory and anti-competitive for a public utility to offer transmission service that was not comparable to that which a transmission owner provides itself.

Building upon this "golden rule" of transmission access, on March 29, 1995, the Commission issued a proposed rule that would require all public utilities subject to its jurisdiction to provide comparable open-access transmission services. The proposed rule also addresses the recovery of costs that may be stranded as a result of the transition to more competitive, market-driven regulation of electric generation at the wholesale level.

The Commission anticipates taking final action on the proposed rule during FY 1996. This will be an enormous and resource-intensive undertaking, to include an environmental impact statement

assessing the economic and environmental effects of the rule. Comments on the proposed rule were filed by more than 400 entities representing all segments of the industry. Furthermore, implementation of the final rule will require new transmission tariffs by more than 150 public utilities subject to the Commission's jurisdiction.

The Commission is also working to address other key issues related to moving to a more fully competitive wholesale market for electric generation, including transmission pricing, alternative power pooling institutions, regional transmission groups, independent system operators, merger initiatives, and the electronic information networks that are necessary to ensure that those who use the open-access transmission systems have fair access to transmission information. We are also considering what changes in the Commission's accounting, reporting, and related recordkeeping requirements will be necessary to implement the Commission's final rule in the open-access proceeding.

While we are grappling with many of these important policy initiatives on a generic basis, EPAct and the increasing competitive pressures in the industry are also increasing our traditional caseload. Part of this increase is simply a function of increasing commerce and the many new participants in the industry (e.g., independent power producers, power marketers). We are also seeing increases in our corporate workload as the industry responds to the competitive changes which are occurring. Many utilities are considering restructuring or potential mergers as they position themselves to take advantage of new competitive opportunities. If undertaken, these actions must be filed with, and approved by, the Commission under the FPA. As new institutions form, such as regional transmission groups, and other institutions evolve, such as power pools and independent system operators, the Commission is facing many new cases involving complex policy issues of first impression. The Commission is also seeing many new and innovative transmission pricing proposals being filed by regulated utilities for approval, including new proposals to augment prior power pooling arrangements.

In short, the Commission's electric workload — both traditional and nontraditional — has increased dramatically. The Commission expects that trend to continue as we guide the industry through the competitive changes that are occurring. Greater resources are required, including increased staffing in the electric program, for FY 1996 and FY 1997 in order for us to continue to fulfill our existing responsibilities under the FPA and, more importantly, to ensure a successful transition to a fully competitive market for wholesale electric generation. The open-access transmission initiatives that we are undertaking will ultimately result in major consumer benefits, increase customer choice, and lower electricity rates in the United States.

Background

Under the FPA we regulate the wholesale power rates, transmission service and rates, and corporate activities of about 370 electric utilities, including a few rural electric cooperatives not regulated by the Rural Utilities Service. The number of electric utilities subject to our rate regulation has increased

in recent years with the emergence of nontraditional entities, such as power marketers and independent power producers. Our workload will also be affected by nonjurisdictional entities such as public power companies filing for Commission determinations that their tariffs provide for open access so they may in turn qualify under the reciprocity provisions of the Commission's open access rule. In this way they will be able to obtain open access. We also determine qualifying facility status for small power producers and cogenerators under the Public Utility Regulatory Policies Act of 1978 (PURPA), determine exempt wholesale generator status under Section 32 of the Public Utility Holding Company Act (PUHCA), as amended by the Energy Policy Act (EPAct), and review the rates of the five federal power marketing administrations.

We analyze and act on filings involving:

- wholesale power sales and transmission of electric energy in interstate commerce by public utilities;
- applications to order transmission service;
- regional transmission groups, exempt wholesale generators, and small power producers and cogenerators;
- corporate mergers and acquisitions, security issuances and assumptions of liabilities, and interlocking directorates;
- power marketed from federal hydroelectric projects; and
- accounting and financial reporting issues.

FY 1995 and FY 1996 Achievements

In the electric power program, we:

- began a series of rulemaking initiatives to promote the transition to a competitive, open access, wholesale electric power market by:
  - (1) issuing a proposed rule regarding nondiscriminatory, open-access transmission and the recovery of stranded costs by public utilities;
  - (2) issuing a draft environmental impact statement on the proposed transmission-access rule;
  - (3) issuing a proposed rule on electronic information network requirements;

(4) accepting for filing 47 open-access tariffs, which were submitted by 78 public utilities following the issuance of the open-access transmission proposed rule; and

(5) holding three conferences relating to pro forma tariffs, power pools, and independent system operators;

- continued implementation of the EPAct and related matters by:

  (1) taking action on seven applications for transmission services filed pursuant to the amended Section 211 of the Federal Power Act; and

  (2) processing 58 exempt wholesale generator applications;

- issued a transmission pricing policy statement in October 1994;

- received filings by 3 regional transmission groups that span the interconnected grid in the western United States (and parts of Canada), approved 2, and conditionally approved 1;

- brought the number of power marketers up to nearly 200;

- initiated a major new inquiry about the function and regulation of power pools, including new potential institutional arrangements to increase wholesale power competition;

- developed and field-tested a software application for electronic filing of our Form No. 1 and issued a final rule requiring electronic filing of this form beginning with the 1994 reporting year;

- established an electronic bulletin board system for Form No. 1 operating and accounting data for public utilities;

- issued a number of orders regarding interpretation of the avoided cost rate standard under PURPA;

- issued a notice of intent on our merger policies in light of the ongoing changes in the industry and the expected increase in merger activity;

- acted on several controversial merger applications, including issuing a hearing order on the proposed El Paso-Central and South West merger, issuing a final opinion approving the Entergy-Gulf States merger, and accepting the PSI-Cincinnati Gas & Electric Company merger, Delmarva-Conowingo merger and the merger of MidWest Resources and Iowa-Illinois into Mid-American Energy Company;

- issued a final rule in January 1995, streamlining the Commission's regulations for rate filings by public utilities, issuances of securities and assumptions of liabilities by public utilities, licensees and others, and rules governing qualifying facilities;

- issued a final rule regarding the permissible types of investments for utilities' nuclear plant decommissioning trust funds;

- issued a policy statement and final rule on coordination transaction ratemaking treatment for emission allowances under the Clean Air Act Amendments of 1990 (CAAA);

- issued the *Annual Qualifying Facilities Report* providing comprehensive information on qualifying facilities certified from the inception of PURPA;

- conducted the eighth biennial review of fuel and energy purchase practices of public utilities for the 1992-93 period; and

- acted on 91 applications filed by public utilities to issue securities or assume liabilities.

FY 1996 and FY 1997 Program Issues

As the electric industry positions itself for the coming competitive electric market, we are experiencing unprecedented growth in our workload in virtually all areas. We believe that this workload is a consequence of EPAct and that it will increase to even higher levels over the next several years. We believe the effort to reinvent electric power regulation will promote greater consumer benefits and a stronger electric industry. The changes occurring in the industry will shift our regulatory efforts from setting cost-based rates for wholesale power suppliers to allowing market forces to set prices. However, we must safeguard competitive power markets by ensuring open, fair access to monopoly transmission and monitoring for affiliate abuses.

The Commission's current efforts to implement the electric provisions of the EPAct and foster Congress' goal to encourage competitive wholesale power markets require us to address key issues involving:

(1) comparable (nondiscriminatory) open transmission access and stranded costs;

(2) transmission pricing;

(3) alternative power pooling institutions and independent system operators;

(4) regional transmission groups;

(5) electronic information networks; and

(6) utility merger policy.

We are laying the groundwork needed to ensure that increased competition and new ways of doing business will provide benefits to consumers and ensure a healthy electric industry. However, much more needs to be done. In this vein, FY 1996 and FY 1997 will require increased resource levels to provide for a smooth transition to a competitive industry.

Electric customers, like natural gas customers, can benefit if competitive suppliers offer them more choices. Along with the states, the Commission is developing new ways to regulate the electric industry that will take full advantage of competition among electric generators. The new electric regulation will also encourage the growth of market institutions and greater efficiency in transmission. Electric customers will see the same benefits as natural gas customers: competitive prices and reliable services better tailored to their individual needs.

The centerpiece of our new electric regulation is comparable (nondiscriminatory) open-access transmission. Comparable open-access transmission will let all potential wholesale sellers and buyers use the interstate transmission grid in the same way. That is the best way to encourage the continued growth of a fully competitive market for generation.

The success of competitive generation ultimately will depend on more than comparable transmission access. It will also depend on better market institutions and better ways to regulate the industry. With respect to better market institutions, we have issued a notice of inquiry on how power pools may work in the future. Additionally, we have begun the process of developing electronic information networks for transmission data. We are also watching developments in the states and in other countries to see what market mechanisms exist.

With respect to better ways to govern the industry, we are supporting the growth of regional transmission groups (RTGs). Membership in an RTG is open to both those who own transmission and those who need to use the transmission facilities of others for wholesale power transactions. RTGs are ideally suited to deal with transmission issues, such as planning for future upgrades and addressing transmission access on a regional basis. We believe that RTGs have the potential to develop into institutions that can resolve many regional issues that would otherwise come to the Commission.

The following discussion highlights what we are doing and how workload and levels of effort will be affected for FY 1996 and FY 1997.

Comparability and Open-Access Transmission

Comparability Cases. In the Spring of 1994, the Commission began to address the problem of the disparity between transmission service that utilities provide to third parties and the service that they provide to themselves. In the American Electric Power Service Corporation (AEP) case, the

Commission announced a new standard for evaluating claims of undue discrimination. The Commission found that an open-access tariff that did not provide for services comparable to those that the transmission owner provided itself was unduly discriminatory and anti-competitive. This standard has been called "The Golden Rule of Transmission Comparability." Currently, processing such tariffs represents a large and increasing workload involving a new and complex issue.

The Open Access/Stranded Cost Rulemaking. On March 29, 1995, the Commission issued a notice of proposed rulemaking (NOPR) entitled Promoting Wholesale Competition Through Open Access Nondiscriminatory Transmission Services by Public Utilities/Recovery of Stranded Costs by Public Utilities and Transmitting Utilities. This proposal initiates what could be the most far-reaching change in the electric utility industry since the implementation of the FPA. Analysis of comments and development of the final rule will extend well into FY 1996.

The NOPR is based on the Commission's obligation to prevent unduly discriminatory practices in transmission access. It finds that the failure of public utilities to offer nondiscriminatory transmission services through open-access tariffs is unduly discriminatory and anti-competitive. The NOPR further finds that the lack of open access by all public utilities impedes the transition to a fully competitive wholesale electric power market, and will lead to a patchwork of transmission systems — some open and some not — to the detriment of consumers.

The NOPR addresses these findings by proposing that all public utilities file comparable open-access tariffs. The tariffs, to be offered to all sellers and buyers of electric energy sold at wholesale in interstate commerce, would offer wholesale transmission services, including transmission-related support services, on a nondiscriminatory basis to third parties. In addition, public utilities would price separately all wholesale generation and transmission services and take wholesale transmission service under their own tariffs.

To assure that the open-access tariffs promote competition and do not operate in an unduly discriminatory manner, the proposed rule would require public utilities to provide all actual or potential users of wholesale transmission services with the same access to information as the public utility enjoys. This will be done through the development of industry-wide electronic information networks.

To provide a fair transition from a tightly regulated to a competitive generation industry, the Commission also proposes to permit utilities to recover legitimate, prudent and verifiable costs incurred to serve customers under the old rules. These are the costs associated with existing power sales contracts that could be rendered uneconomic if customers were able to leave their existing suppliers through open transmission access. Also known as stranded costs, they may result in complex and controversial proceedings where potentially tens of billions of dollars are at stake.

Following the open-access proposal, the Commission has held technical conferences on the development of real-time information networks, ancillary services (generation service necessary to

the provision of transmission service), application of open access to power pools, pro forma tariffs, and independent system operators. As the Commission implements the final rule, it may be necessary to convene additional technical conferences.

Implementing Open Access. The open-access tariff requirement would be implemented for all public utilities that own or control transmission facilities.

For utilities that voluntarily file open-access tariffs prior to a final rule, the Commission proposes to require any necessary upgrades to meet the substantive requirements of the final rule within a specific time period. For utilities that do not voluntarily file open-access tariffs prior to a final rule, the Commission proposes to put tariffs into effect 60 days after the final rule goes into effect. Rates for the majority of these filings likely will require hearings.

The Commission expects more than 150 open-access tariffs to be either put on file or revised as a result of the rulemaking; in fact, a significant number of these have already been filed. Since these tariffs may be contested, particularly as to rates, processing them will impose a significant workload burden on Commission staff resources.

Implementing Stranded Cost Recovery. Proposed implementation of the stranded cost provisions of the rulemaking would require the processing of a number of new cases. Utilities would be able to request changes to existing wholesale contracts to allow for an exit fee to recover stranded costs. Alternatively, they could seek recovery through transmission rates. They would be required to make a showing that they had a reasonable expectation of continuing to serve a wholesale customer, and then would have to demonstrate how much revenue would be lost should a customer depart, in order to justify the recovery of stranded costs. Cases also may arise when contracts expire, or when customers or utilities need to gain certainty as to their stranded cost exposure for purposes of planning. The Commission would have to review and approve, on a case-by-case basis, any proposal to recover wholesale stranded costs.

Creation of new wholesale entities and incidences of retail wheeling are less predictable than expiration of existing contracts. The process in such cases, however, would require procedural steps similar to those described above.

Implementation of the stranded cost rule would require treatment of issues never before dealt with by the Commission. It would place an entirely new burden on the Commission, as well as add significant new case load.

Economic and Environmental Impacts. The Commission is currently preparing an environmental impact statement (EIS) to assess the economic and environmental impacts of its proposed rule on open-access transmission. A draft EIS was issued for comment in November 1995. The analysis is national in scope — but with significant regional detail — assessing both short term and long term impacts of the proposed open-access rule. The Commission is examining two

alternatives: (1) a base case under which transmission access continues to be implemented on a utility-by-utility basis and (2) a proposed case under which all utilities subject to the Commission's jurisdiction would be required to file open-access wholesale transmission tariffs (and to take service under those tariffs) 60 days after the final rule is published in the Federal Register. The goal is to determine what, if any, environmental impacts may be caused by the proposed rule, with particular attention to the effects of potential increases in air emissions caused by a change in generation fuel mix; e.g., to examine whether mandating open-access transmission would cause more coal to be burned, thereby raising nitrous oxide emissions. We requested comments on the draft EIS be submitted by February 2, 1996; we received nearly 500 pages of comments from 45 parties. We are currently reviewing those comments and expect to issue a final EIS this spring.

Transmission Proceedings

Nondiscriminatory transmission access is essential to create a competitive wholesale market for electric power. Assured open transmission access — that is, access available to all buyers and sellers of wholesale power — is necessary for nontraditional sources of generation to compete effectively with traditional electric utilities. In addition to the open access that would result from implementing the final rule, the Commission's open-access caseload is rapidly growing in other contexts as well, and is presenting issues that have never been dealt with before. It is clear that many complex issues will call for the Commission to expand its staff and build on its technical expertise. The Commission is aggressively promoting regional transmission groups, and they may help limit the additional technical resources needed. However, the Commission is the ultimate forum for industry disputes. Unless the industry can develop workable alternative institutions for resolving technical disputes, additional resources will be required.

Consequently, we expect our growing transmission-related workload to include:

- applications requesting the Commission to order transmission under Section 211, voluntary offers of open-access transmission under Section 205, and the filing of open-access tariffs in compliance with the Commission's proposed rulemaking;
- new approaches to the pricing, terms, and conditions of both firm and nonfirm transmission service;
- proposals for voluntary transmission associations (regional transmission groups) to deal with the increasingly complex technical aspects of enhanced transmission access, dispute resolution, and multi-party system planning; and
- disputes about transmission system reliability and allocation of capacity as existing capacity becomes more fully utilized and more frequently constrained.

Requests for Transmission Service under FPA Section 211. The electricity provisions of the EPAct expanded the Commission's authority to compel a utility to provide transmission service. Specifically, Congress modified Section 211 of the FPA to allow the Commission to order specific transmission services, upon request, if it finds the request is in the public interest and will not unreasonably impair utility system reliability. This provision has given the Commission the ability to reduce sharply the monopoly power that transmission system owners can exercise by favoring the transmission of their own electric generation supplies over the transmission of other generation supplies.

Under Section 211, we have received 25 transmission access applications through February 1996. Of these, ten were granted, three were rejected, three were withdrawn, and nine are awaiting action.

Voluntary Transmission Tariff Applications. Voluntary transmission tariffs of general applicability provide greater assurance against market power than do specific orders under Section 211. However, the open-access service provided must be on a basis that is not unduly discriminatory among transmission users. The Commission is processing an avalanche of voluntary open-access transmission tariff applications, many of which raise comparability issues.

Applications under the Pricing Policy Statement. To serve the long-term purposes of increased competition, reliability, efficiency, and equity, in October 1994 the Commission issued a transmission pricing policy statement, which permits utilities to propose a wide range of nontraditional pricing proposals. These include distance-sensitive pricing, loop-flow pricing, and other innovative concepts. As a result, we are just starting to see innovative proposals that raise new, complex and, hence, time-consuming technical and economic issues.

Regional Transmission Group Applications. In order to capitalize on the significant technical resources of the electric industry, we are encouraging RTGs to help implement transmission services and resolve transmission issues on a regional basis. The Commission believes that properly functioning RTGs will serve the public interest by enabling the market for electric power to operate in a more competitive and, thus, more efficient manner. Further, RTGs provide coordinated regional planning of the transmission system to assure that system capabilities are adequate to meet system demands. RTGs also will decrease the delays that are inherent in the regulatory process, resulting in a more market-responsive industry. Furthermore, RTGs may significantly enhance regional transmission planning by providing a mechanism for cooperation among state commissions and the utilities they regulate. The Commission has expressed a willingness to give deference to agreements reached voluntarily under an approved RTG.

RTGs have the potential to provide substantial benefits to the public and the Commission by relieving regulatory burdens and by providing a forum for consensual agreements within new regional institutions. They can channel the expertise of the electric industry toward resolving technical issues relating to transmission system operations and toward planning the transmission system to meet the needs of all parties.

The first three RTG filings were made by western utilities. The Commission accepted two of the proposals on a final basis, and accepted another conditionally in FY 1995. Our ongoing close interactions with power pools and others in the industry indicate that one RTG filing is being developed, and three other groups are seriously studying developing RTGs. Another five groups are contemplating forming RTGs. We expect that RTG applications and the ongoing oversight of approved RTGs will constitute a considerable workload in FY 1996 and FY 1997.

Electric Power Generation Proceedings

Traditional Cost-Based Rates. We regulate two basic categories of wholesale electricity sales transactions: requirements sales and coordination transactions. Requirements sales are long-term commitments by suppliers of power to meet reliably all or part of the buyer's load. Coordination transactions are sales or exchanges of electricity between utilities for economic purposes and to augment reliability.

We have already seen a significant increase in rate applications for both requirements sales and coordination transactions and, as utilities respond to competitive pressures, we expect additional workload increases through FY 1997.

Even with greater efforts toward conservation and load management, utilities will likely need substantial additional capacity to avoid capacity constraints and reliability problems during the next decade. Some utilities are preparing for this likelihood by constructing new generating capacity themselves or by arranging for purchases of generating capacity from new generating entities. We expect continuing high levels of rate applications from traditional utilities seeking to recover, in wholesale rates, the costs of new construction or purchased power. We also expect significant additional caseload from the adjustments to rate structures that utilities must make to meet the increasing pressures of competition. In addition, as competition develops, contracts are of shorter duration and are renewed or reassigned more frequently, an additional impact on our workload.

Increasingly, traditional utilities are relying on nontraditional sources to satisfy their generation needs. A new nontraditional power sector has emerged to supply the power needs of some traditional electric utilities that are reluctant to undertake new construction. These nontraditional companies — including affiliated power producers, independent power producers, and qualifying cogenerators and small power producers — are constructing generating facilities for the purpose of selling their output to existing utilities. In recent years these sources have comprised over half of all new installed capacity. This change in the way traditional utilities obtain additional power means changes in the types and number of cases we handle.

When a traditional utility buys power from a nontraditional utility, the resulting work for the Commission may involve as many as four proceedings. If the power seller is an EWG, there will be a certification proceeding. In addition, there must be rate proceedings for the power seller, for the utility passing through the increased purchased power costs, and, possibly, for a third-party

transmission supplier. Eventually, as a result of open access and as market-based generation rates become more prevalent, the rate proceedings should become more streamlined. In the interim, however, the Commission will continue to face high levels of workload, as it continues to deal with traditional rate cases and, at the same time, puts into place competitive mechanisms.

Automatic adjustment clauses allow electric utilities to change rates to reflect some cost changes without filing with the Commission. To ensure efficient use of resources, PURPA directs us to review the automatic adjustment clauses in jurisdictional rate schedules every four years, and the energy and fuel purchase practices of utilities using such clauses every two years. We will continue to scrutinize applications to ensure that utility proposals are consistent with our fuel-adjustment clause regulations and accounting procedures, and that costs associated with the Clean Air Act Amendments compliance and power purchases, if reflected in automatic adjustment clauses, are appropriate.

The Regulatory Fairness Act (RFA) amended the FPA to provide up to 15 months of refund protection to ratepayers whose existing rates for electric service are found to be too high. We anticipate that the number of RFA proceedings will continue to increase. Because refund protection lasts only 15 months, we must continue to handle these proceedings as expeditiously as possible.

We expect to continue processing litigated electric rate cases involving:

- performance incentive rate proposals;
- transmission rate levels and design;
- intercompany coordination arrangements;
- continued reasonableness of arrangements under existing power pools;
- interpretation of the terms and conditions of service under power supply and transmission contracts;
- ancillary service issues (e.g., reactive power, load following) associated with transmission-only service;
- post-retirement benefits other than pensions issues;
- nuclear plant decommissioning costs and funding issues;
- premature plant shutdowns;
- costs related to buy-outs and buy-downs of fuel supply contracts; and

- changes in rates related to potential changes in corporate income taxes.

Requests for Market-Based Electric Rates. Traditionally, we have set rates for vertically integrated monopoly utilities based on their costs. Many new entrants into electric markets generally lack market power because they do not own generation or transmission facilities or have a franchised service territory. We often permit them to charge market-based rates. Those affiliated with traditional utilities also may sell at market-based rates, but they present an array of difficult market power, self-dealing, and affiliate abuse issues that are not presented by truly independent power entities. This situation requires extra scrutiny by the Commission, and often requires specific conditions to prevent affiliate abuse.

New entrants in the markets include nontraditional power producers, which may be independent power producers or power producers affiliated with traditional investor-owned utilities.

Power marketers are another new type of entrant. They usually do not produce power, but buy and sell power generated by others. While marketers do not increase the amount of capacity available to meet the needs of consumers, they can contribute to increased market efficiency to the benefit of ultimate consumers. They also increase the Commission's workload. We have authorized most power marketers to charge market-based rates subject to appropriate conditions and have waived some of our regulations for them. The Commission has authorized nearly 200 power marketers thus far, and the number grows daily. Moreover, in FY 1995 the Commission relaxed its reporting requirements for power marketers. This could induce even more entrants into this already burgeoning field. We expect the number of applications by power marketers to rise substantially through FY 1997.

We have developed new analytical procedures for reviewing filings made by applicants requesting approval of market-based prices. They generally do not establish their rates on a traditional cost-of-service basis. We will continue to process market-based rate filings on a case-by-case basis to ensure that the proposed rates are just and reasonable. More experience evaluating market-based rates will help us develop criteria to simplify and standardize the nontraditional supplier's rate application process.

Exempt Wholesale Generators. EPAct directs the Commission to determine, upon application, the EWG status of firms engaged in owning or operating facilities used for the sale of power at wholesale. The purpose of EWG status is to exempt the facility's owners from the requirements of PUHCA. Although many of these EWGs are affiliates of U.S. companies doing business overseas (often in newly privatized electric industries and markets), we expect the class of independent power producers known as EWGs to provide a significant percentage of new domestic generation requirements in years to come.

Through December 1995, we received over 300 applications for EWG status. Even though the Commission's role in acting on these applications is largely ministerial, we expect to see some

increase in workload from EWG applications, until issues concerning statutory interpretation are resolved. Moreover, because most EWGs located in the United States become public utilities when they start making power sales, we anticipate more rate and other applications by EWGs in FY 1997 and beyond, as projects begin operation.

Qualifying Facilities and PURPA Issues. Our experience with cogenerators and small power producers — another class of nontraditional power producers — continues to evolve. PURPA authorizes the Commission to certify small power production and cogeneration facilities as qualifying facilities (QFs) and, in certain cases, to exempt them from some federal and state regulations. PURPA regulations require electric utilities to offer to buy electricity from QFs at a rate that does not exceed the utility's cost of producing the electricity itself or acquiring it elsewhere (i.e., the "avoided cost").

The Commission's PURPA enforcement caseload has increased significantly with competitive pressures in the industry. Many utilities have begun challenging state implementation of PURPA, arguing that they are being required to buy capacity that is above their avoided cost. Others have sought to be relieved of their obligations under QF contracts that have become uneconomic. Yet others have challenged QF status before the Commission in an effort to break contracts with the QFs. The Commission has recently addressed a number of difficult PURPA implementation issues, including cases involving state implementation in Connecticut, California, Illinois, Massachusetts, New York, and Pennsylvania. Other cases are pending.

We continue to address the issues that QF applications raise. These issues include:

- novel uses of waste and renewable resources as fuel for small power production facilities, as well as unusual applications of the thermal output of cogeneration facilities;
- more frequent participation in QFs by electric utilities;
- complex ownership and financing arrangements supporting QF projects;
- more frequent requests for waiver of the Commission's QF regulations;
- challenges to state proceedings concerning power pricing and jurisdictional issues;
- more frequent challenges by local government entities, utilities, and private organizations to applications for QF status; and
- requests that the Commission revoke certification of certain QF projects that fail to meet the Commission's standards.

23-254 96 – 88

Federal Rate Applications. We review the rates for the five federal power marketing administrations (PMAs). The approximately 130 federal hydroelectric projects comprise 23 reporting units, some of which make multiple applications. These filing units may apply to us as frequently as every year, but not less than once every five years. The frequency of such applications depends on the economics of marketing the surplus federal power and transmission services. We estimate that the number of applications will increase slightly as the PMAs respond to competitive pressures.

Corporate Applications

Corporate Restructuring. Utilities are preparing for increased competition in electric markets by reorganizing their corporate structure, merging with their neighbors, and diversifying. To isolate unregulated activities from the regulated utility part of their companies, many utilities have reorganized themselves under a holding company structure. This makes the regulated utility a wholly owned subsidiary of the newly formed holding company. Such restructuring involves a disposition of utility assets requiring Commission authorization.

As the transformation to competitive markets continues, many utilities are expected to create separate transmission, generation, and distribution entities to replace the existing vertically integrated corporate structure. Reorganizations along functional business lines will likely include further consolidations in each functional area with new regional organizations being formed. The mergers and asset dispositions necessary to create the new corporate structures will require Commission authorization.

There are a number of reasons to believe that the pace of corporate restructuring will accelerate. Our proposed open-access rule and actions by many state commissions responding to the changes in electric power markets will lead some utilities to restructure. In the case of some state proposals, these restructurings would be required. Congress is considering several proposals that could affect utilities' corporate structure, such as allowing electric utilities to provide telecommunications services and reforming or repealing the PUHCA.

Utility mergers are becoming more frequent as utilities strive to increase market share, stave off or remedy bankruptcy, or increase efficiency. Merger applications are normally contested and extremely complex. Competitors who view such business combinations as imposing greater barriers to market entry or eroding their relative market share may vigorously oppose mergers and acquisitions. We expect mergers to be a growing workload area in the coming years.

In merger and asset disposition cases, we must determine whether the proposal is consistent with the public interest. This involves considering:

- the effect of the merger on costs and rates;
- the impact the combination may have on the effectiveness of regulation;

- accounting implications of the merger;
- evidence of coercion;
- reasonableness of the purchase price; and
- the effect of the merger on competition.

When the Commission has found that a merger would adversely affect competition or otherwise not be in the public interest, it has imposed appropriate conditions to offset these adverse effects, including requiring open access to transmission systems. Furthermore, as the electric industry has become more competitive, the Commission has found that it is in the public interest to require all merging utilities, and utilities otherwise acquiring interstate transmission facilities, to offer comparable open-access transmission services to mitigate their market power.

We have initiated a notice of inquiry to determine whether our prior evaluation of mergers and standards for approval should be modified in light of ongoing changes in the industry.

Interlocking Directorate Applications. The FPA imposes restrictions on those serving as officers and directors of public utilities. The Commission continues to enforce such restrictions, which require investigation of corporate entities to prevent the potential for adverse effects on the public interest through self-dealing and other abuses. EWGs and affiliated power marketers are increasing the number of inter-utility corporate interlocks of officers and directors. Careful review of interlocking positions is ever more critical as public utilities diversify. We have also maintained jurisdiction over certain interlocks involving registered holding company systems.

Other Issues

Power Pooling Agreements/State Restructuring Initiatives. Power pool agreements are multi-utility agreements for sharing generating capacity reserves and providing a central means of economic dispatch, trading, and transmission of electric power. These complex agreements, a number of which have been approved by the Commission, are difficult to develop and maintain, but they lower costs for the pool members.

The changes occurring in the industry, including the development of nondiscriminatory open-access transmission, are likely to require changes in existing pooling agreements. These will need to be approved by the Commission and will be very resource-intensive proceedings.

In addition to existing power pools, we expect that new power pools will develop to operate transmission centrally, provide for an electricity spot market, and facilitate competition. In December 1995, the California Public Utilities Commission ruled that an independent system operator and separate power exchange be created. The Commission will regulate these new entities because

of their wholesale nature. Their formation will present numerous complex jurisdictional, technical, and market power issues.

The California actions may be the precursor to other new applications resulting from state electric utility restructuring initiatives. Over 40 states have initiated some type of investigation into electric utility restructuring. Many of these could result in forming new institutions or reforming utilities' business activities with some aspect of the restructured activities regulated by this Commission.

To prepare ourselves for these new arrangements and the issues they will bring, the Commission issued an Inquiry Concerning Alternative Power Pooling Institutions under the Federal Power Act in October 1994. This inquiry was subsequently incorporated into the open-access rulemaking and separate technical conferences were held on this and other interrelated issues.

Implementing the Clean Air Act Amendments. The CAAA imposed an obligation on electric utilities to cut in half total industry sulfur dioxide (SO_2) emissions by the year 2000. To minimize SO_2 emission compliance costs, the CAAA created a nationwide market for tradeable SO_2 emission allowances. Utilities must either reduce their annual emissions to their allocation level or purchase allowances from other owners. New generators must acquire allowances from other participants in the allowance market. Allowance trading raises a number of novel regulatory issues, which we are addressing.

We are seeing additional rate applications as utilities seek to reflect in jurisdictional rates the costs of allowances they purchase, use, or sell. Compliance will affect some 60 jurisdictional electric utilities by virtue of their ownership of particular coal-fired generating plants. Since many of these utilities have numerous rate schedules on file with the Commission, hundreds of rate schedules may ultimately require revision. In addition, we believe that the rate schedules of several large holding company systems will require modification to account for the allocation of CAAA compliance costs among the operating companies that make up these systems.

Reporting of Accounting, Financial, and Industry Data. An essential element in our electric program is reliable financial accounting information based on sound accounting principles, which are contained in the Commission's Uniform System of Accounts and uniformly applied to all jurisdictional companies. Financial and operational data collected through filings of Form No. 1 are an integral part of the Commission's regulatory scheme. In FY 1995, we instituted electronic filings for Form No. 1.

In general, we audit each electric utility every 5 to 6 years to ensure the integrity of the accounting data and compliance with the Uniform System of Accounts and related regulations. Accounting data gives us information on investment costs of facilities, the cost and types of capital used to finance such investments, and operating costs and revenue data we use to establish just and reasonable rates and to determine compliance with the rate schedules on file.

The scope of the audits includes a review of billings under automatic adjustment clauses and formula rates. We require companies to make refunds to wholesale customers when the audits disclose improper billings under such rate mechanisms.

Summary of Electric Power Workload and Resource Needs

The electric program workload is burgeoning and will require significant additional resources. Some of the additional workload represents an increase in traditional rate filings. More new participants continue to enter wholesale electricity markets, more wholesale power is traded, and there appears to be a trend towards more and shorter-term power deals. Further, many utilities may merge or otherwise reorganize as power markets evolve, which will increase the Section 203 filings the Commission receives.

We also have a developing nontraditional caseload as a result of the EPAct and the emergence of competition in the wholesale bulk power market. Examples of this workload are requests for transmission service under FPA Section 211, EWG certification requests, requests for market-based generation rates, and regional transmission group filings. The complexity of cases is increasing, and more cases raise issues of first impression.

At the same time, the Commission is launching several generic policy examinations of major issues confronting the electric power industry. Of these, the most significant is the recent proposed rulemaking on nondiscriminatory open-access transmission and stranded cost recovery.. Issuing a final rule will involve several major efforts, carried out in parallel, on electronic information networks, pro forma tariff design, ancillary services policy, power pooling policy, and environmental impacts. Implementation of the final rule will require putting compliance tariffs into effect for more than 150 public utilities 60 days after publication of the final rule.

The rule will result in a surge of formal compliance filings; workload to complete implementation will remain high for several years, as it did when the Commission restructured the gas industry. For example, many public utilities may file superseding tariffs, or customers may challenge aspects of the compliance tariffs. Many of these filings will involve innovative transmission pricing proposals and will require new pricing policy development. Implementation of comparability for power pools will be a complex, and potentially resource-intensive, effort — particularly if the Commission is required to institute individual Section 206 complaints against existing power pools. The rule will also result in many requests to recover stranded costs. Such filings are likely to be contested and set for hearing. Accordingly, implementation of the open-access rule will require more electric program staff, into FY 1997 and beyond.

The Commission also began an inquiry into alternative power pooling institutions, and at least one state (California) has required its jurisdictional utilities to establish an independent transmission system operator and a power exchange. Other states and regions are considering different ways of organizing their electric power markets. Many states are considering retail access, and the

Commission may be called upon to set rates for retail transmission. As alternative power pooling and market institutions develop, the Commission will have to address difficult cost allocation, jurisdictional, and other regulatory issues. The Commission may also have to develop different policies and procedures tailored to the characteristics of alternative power pooling arrangements in each region. The time and staff required to deal with these new issues and to interface with state and regional organizations will increase.

We anticipate that the Commission will be called upon to undertake new activities as the electric power industry continues to evolve. The Securities and Exchange Commission has called for PUHCA repeal and for us to take on many of the consumer protection functions that it currently performs. Legislation (S. 1317) to repeal PUHCA was introduced in the Senate in August 1995. It seems likely that further changes in the electric industry, including potential industry restructuring, may call for new generic inquiries in the next few years that we cannot now specifically identify. Because of the uncertainty of these potential responsibilities, no resources have been requested in this budget for PUHCA reform.

Over the long term, electric program staffing needs may decrease from the higher levels projected for the next few years. Open access, competition, and new institutions in the industry should ultimately reduce the Commission's electric workload. The Commission may rely less on cost-based regulation of generation and more on market-based pricing. New institutions, such as RTGs and poolcos, may evolve to substitute for some aspects of our regulation of the industry. But, whatever our workload requirements may be 5 or more years into the future, it is clear that the electric program needs additional staff and resources now to cope with the current surge in workload and to continue to meet the challenge of fostering the development of a vibrant and fully competitive market for wholesale electricity.

It is vitally important for the Commission to have the necessary resources to help shape the new electric power supply industry. Literally hundreds of billions of dollars are at stake. With a relatively small investment, the Commission will be able to provide decisive leadership in this critical time of industry transition. Every consumer of electricity has a right to expect us to meet the crucial responsibility of consumer protection while promoting a healthy, reliable industry.

SUMMARY ELECTRIC POWER WORKLOAD

Receipts

	FY 1994[3] Actual	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Rates and Transmission	1,186	2,274	3,608	3,767
Other Electric	1,024	1,203[4]	1,028	1,063
TOTAL	2,210	3,477	4,636	4,830

Completions

Rates and Transmission	1,551	2,088	3,600	3,762
Other Electric	981	1,105	1,045	1,070
TOTAL	2,532	3,193	4,645	4,832

Year-End Pending

	FY 1994[3] Actual	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Rates and Transmission	608	794	802	807
Other Electric	369	467	450	443
TOTAL	977	1,261	1,252	1,250

[3] FY 1994 receipts and completions are included in this table to provide a fuller picture of the growing substantive workload in electric power.

[4] Includes 190 one-time small power filings pursuant to the Solar, Wind, Waste, and Geothermal Power Production Incentives Act of 1990.

HYDROPOWER
Operating Expenses
($ in Thousands)

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Request
FUNDING	$56,949	$52,300	$53,429
FTEs	455	454	444

Overview

Hydropower is a domestic, renewable resource that offers an abundant, clean source of electric energy. The 1,651 hydropower projects we regulate represent over half the Nation's hydropower energy generation. Hydropower makes up 96 percent of our total renewable energy production and provides about 13 percent of the country's electric capacity. In FY 1994, hydroelectric production was about 244 billion kilowatt-hours, the equivalent of about 410 million barrels of oil or 100 million tons of coal. Use of hydropower avoids the consumption of oil from foreign sources; this contributes to national security and advances the goal of energy self-sufficiency. Hydropower also makes a significant environmental contribution in that the avoidance of coal burning prevents the annual discharge into the atmosphere of up to 7.7 million tons of particulate matter.

The Commission regulates non-federal hydropower for the benefit of the public, considering all resources and beneficial uses of the Nation's waterways. In recent years, the focus of the Commission's hydropower program has been the relicensing of the 157 licenses that expired in 1993. As that effort draws to a close — we anticipate most of these relicensing cases will be completed by the end of FY 1996 — our focus will turn to ensuring compliance with the terms and conditions of these new licenses. As a result, staff will be transferred from licensing to the compliance and dam safety activities. In addition, because of increased efficiencies in how we perform our compliance and safety activities and the need to use personnel in other programs, the FY 1997 request includes 10 fewer FTEs than FY 1996 for the hydropower program.

In spite of fewer FTEs devoted to this aspect of the Commission's work, we expect to continue to respond to our stakeholders' interests and to the changing role of hydropower in the Nation's energy

future. In doing so we will continue to evaluate the need for new capacity development and increased efficiency at existing hydropower projects, while considering environmental requirements. In doing so, we focus on:

- encouraging and ensuring comprehensive, multipurpose uses of the Nation's water resources, while protecting the environment, mitigating harmful impacts, and enhancing resource values;
- reducing regulatory delay and eliminating as much uncertainty as possible for water-resource developers, federal and state agencies, and nongovernmental organizations;
- ensuring compliance with all Commission authorizations and environmental laws;
- ensuring efficient, integrated operations at all licensed and exempted projects;
- encouraging public participation and input into our processes;
- employing licensing, relicensing, and compliance processes that consider the concerns of other federal agencies, state governments, and the public;
- carrying out a dam safety inspection and evaluation program to ensure that the aging population of dams meets rigorous safety requirements and current dam safety standards;
- ensuring that the recreational facilities at licensed projects are adequate and safe for public use;
- improving dam safety engineering guidelines to ensure appropriate, cost-effective approaches to dam safety remediations;
- requiring full tests of emergency action plans; and
- providing guidance to the hydropower community to help identify and reduce the occurrence of common compliance problems.

We look for ways to facilitate our review and decisionmaking on water resource projects, while protecting environmental and other values. This ensures that projects are developed and operated in the public interest. Among our highest priorities are initiatives to:

- complete, or near completion of, the relicensing workload from the projects whose licenses expired in FY 1993;
- improve our licensing and relicensing processes;

- strengthen compliance and dam safety programs;
- resolve disputed issues through settlements and other means of alternative dispute resolution;
- continue to encourage development of additional hydropower capacity through project efficiency upgrades;
- continue to pursue cooperative working relationships with federal and state agencies; and
- reduce pending workload levels.

FY 1995 and FY 1996 Program Achievements

Hydropower Licensing. During FY 1995, the hydropower licensing area had a number of important achievements. We:

- continued processing the relicense applications from licenses that expired in 1993. For this group of 157 applications we issued 19 licenses, completed 19 additional project environmental assessments (EAs), issued 6 single- and multi-project draft environmental impact statements (EISs) and 1 final EIS, and initiated the preparation of 21 other environmental documents;
- took final action on applications for 27 original licenses and 22 relicenses, including 19 of the licenses that expired in 1993;
- issued a policy statement on the use of reserved authority in licenses to ameliorate cumulative impacts, stressing the importance of resolving cumulative impact issues at the licensing stage to the extent feasible;
- issued a policy statement on project decommissioning at relicensing that concluded: (1) under limited circumstances, the Commission has the authority to deny a new license at the time of relicensing; (2) when a project required to be licensed will no longer be licensed, it must be decommissioned in an appropriate manner; and (3) where specific facts warrant that result, the Commission may impose conditions in a license that require pre-retirement planning and funding;
- changed our method of doing project economic analyses in light of significant competitive changes in the electric industry, and clarified the role of economic analyses in licensing proceedings;
- conducted 16 negotiations with fish and wildlife agencies under Section 10(j) of the FPA;

- prepared four river basin EAs in cooperation with the U.S. Forest Service for proposed hydropower projects to be located on lands managed by the Forest Service;

- worked with the Council on Environmental Quality and five other agencies and nongovernmental organizations to prepare a Cumulative Effects Handbook that will be useful in analyzing hydropower projects;

- assisted several potential applicants, prior to application filing, in developing third-party, applicant-prepared EAs and EISs, thereby reducing the time required for staff review after filing;

- resolved a dispute over entrainment and mortality studies that was interfering with timely processing of Niagara Mohawk Power Company's pending relicense applications;

- assisted in settlement talks that resulted in settlement agreements being filed for the Deerfield River Project in Vermont and Massachusetts, the relicensed project with the greatest installed capacity of the 157 licenses that expired in 1993, and for six Saco River projects;

- prepared the Saco River Basin draft EIS, covering two relicense and one exemption application, providing information for future Commission action on the multi-project, river-basin-wide settlement agreement on fish passage improvements; and

- improved policy coordination between the Commission and other federal agencies.

Dam Safety and Inspections. During FY 1995, we accomplished the following in the dam safety and inspections area:

- completed 600 dam safety evaluations and 3,018 inspections;

- completed 43 emergency action plan tests at major multi-development projects;

- conducted state-of-the-art seismic evaluations to assess the merit of new seismic theories;

- conducted seismic analyses to evaluate embankment dams constructed by hydraulic fill methods and those embankment dams founded on loose, potentially liquefiable soils;

- refined procedures for developing: (1) regional Probable Maximum Precipitation (PMP) values and resulting Probable Maximum Floods associated with dam safety reviews, and (2) site-specific PMP values that have resulted in reducing or eliminating dam safety remediation measures;

- required safety modifications at more than 100 dams;

- reduced the number and scope of dam safety modifications, without compromising the public's safety, that resulted in a savings of over $25 million for project owners;

- provided technical assistance on dam safety to the Nuclear Regulatory Commission and DOE;

- provided training related to emergency action planning for dam emergencies to state dam safety officials and to owners of dams that fall under state jurisdiction; and

- issued an Engineering Guidelines chapter on Monitoring and Instrumentation of Dams; began work on new chapters for Existing Arch Dams, for Water Conveyances, and for Unique Types of Dams; and reviewed and began revisions to existing chapters on Embankment Dams, Gravity Dams, Probable Maximum Flood, and Foundations, consistent with staff studies and current changes in state-of-the-art procedures and methodologies.

Project Compliance and Administration. In the project compliance and administration area, we:

- completed 40 EAs for license or exemption amendments, surrender of licenses, and exemption revocations;

- initiated preparation of 4 EISs;

- completed a final EIS and authorized construction of a water supply withdrawal to serve Virginia Beach from the Lake Gaston and Roanoke Rapids Project No. 2009;

- completed action on about 1,200 post-licensing amendment items;

- reviewed approximately 25 reopener article proceedings (the re-evaluation of existing projects to determine the need for environmental protection measures not anticipated during original licensing);

- completed 24 compliance audits;

- issued a final rule reforming hydropower administrative annual charges;

- approved 8 efficiency upgrades at licensed or exempted projects totaling 25.4 megawatts of additional capacity;

- assessed more than $800,000 in civil penalty fines for violations, including failure to maintain safe public recreational facilities, install required gauges, and maintain required minimum flows and dissolved oxygen levels;

- completed headwater benefits determinations for 5 river basins, resulting in $0.9 million in headwater benefits assessments, in addition to $6.0 million in annual assessments, for a total assessment of $6.9 million;

- initiated the use of a PC-based version of the Commission's Headwater Benefits Energy Gains computer model;

- evaluated the effectiveness of compliance staff presence in a regional office to address emerging environmental issues, and reviewed the need for such presence in all regional offices;

- integrated geographic information system technology into navigation studies in evaluating project jurisdiction;

- completed the first third-party contractor-prepared post-licensing EA, which reduced time required to process the case and resulted in a savings to the Commission in staff and contract resources;

- completed license transition actions with 11 project owners and interested resource agencies, in which the owners were given detailed information on their license requirements to help ensure future compliance; and

- evaluated the feasibility of the compliance liaison activity, which supports small project licenses and exemptees to minimize compliance violations.

During the first quarter of FY 1996, we have:

- issued 5 new licenses;

- issued 12 environmental documents (6 draft EISs, 2 draft EAs, 1 final EIS, and 3 final EAs) involving 24 projects, 18 with licenses that expired in 1993;

- participated in 4 settlement meetings involving 12 relicense applications;

- requested comments on the National Hydropower Association's petition for revisions to the Commission's relicensing process;

- issued 11 EAs for proposed modifications at licensed or exempted projects;

- assembled a multi-disciplinary license transition team and conducted 11 pre-license issuance reviews of draft orders in the Wisconsin River basin to help ensure that owners of recently

licensed and relicensed projects clearly understand the terms and conditions of their licenses, their responsibilities, and the steps needed to achieve and maintain compliance;

- approved an efficiency upgrade at a licensed project;
- initiated 21 headwater benefits studies and 3 three headwater benefits determinations;
- evaluated interfacing project exhibit aperture cards with a geographic information system;
- conducted 191 dam safety inspections;
- completed 353 dam safety engineering evaluation studies; and
- served on subcommittees of the Interagency Committee on Dam Safety, tasked to review and update the "Federal Guidelines for Dam Safety" published in 1979.

FY 1996 and FY 1997 Program Issues

In FY 1996 and FY 1997, we plan to:

- complete our multi-year relicensing activity for projects whose licenses expired in 1993;
- begin the transition to the post-relicensing phase for the licenses that expired in 1993, involving increased license administration with a concomitant shift of resources;
- implement the Commission's policy statements on decommissioning and cumulative impact reopener articles;
- increase analysis of cumulative impacts of multiple projects and participate in settlement conferences;
- expand staff involvement before applications are filed by helping to implement new third-party contracting provisions, including holding scoping meetings and conducting site reviews, and resolving conflicts between agencies and applicants;
- continue to analyze water resource projects consistent with achieving comprehensive development, protecting environmental resources, maintaining dam safety, and ensuring compliance with authorizations we issue;
- explain our approach to licensing, relicensing, and post-licensing administration through interactive activities and outreach meetings with members of the public, resource agencies, and the hydropower industry;

- continue to address the many environmental issues at projects that were built and began operation more than 30 years before the enactment of the NEPA;
- increase the frequency of inspections of low hazard potential dams to help avoid dam failure and subsequent environmental and economic loss;
- expand participation in activities of the dam safety community to develop improved technical tools and procedures for analyzing the stability and adequacy of dams, determining economical remedial measures, and reducing dam safety costs;
- continue to train licensees and exemptees on emergency action planning and testing and require comprehensive testing of emergency action plans with participation by emergency preparedness agencies;
- improve the Engineering Guidelines consistent with state-of-the-art advances and developments;
- meet more often with other federal agencies and technical groups to discuss dam safety issues and coordinate improvements to dam safety programs in the U.S. through the Interagency Committee on Dam Safety;
- improve program efficiency through an investigation of automated data filing, continued development of a consolidated database and management information system, and continued development of a geographic information system;
- investigate and bring into compliance violations of hydropower licensing and exemption requirements;
- evaluate the jurisdictional status of unlicensed hydropower projects and start the licensing process for those that are required to be licensed;
- encourage licensees to undertake efficiency upgrades;
- require licensees to modify project facilities and operations to accommodate environmental concerns identified by the Commission and natural resource agencies;
- continue efforts to improve coordination with other federal agencies; and
- work with our licensees during the critical 6 to 12 months after license issuance to improve compliance.

Hydropower Licensing

We issue three types of authorizations for hydropower development: preliminary permits, licenses, and exemptions from licensing. Permits allow holders to study the development potential of sites for three years with the exclusive right to apply for a license or an exemption during the permit's term. Original licenses are effective for up to 50 years. We issue exemptions to certain small projects in perpetuity; exemptions do not confer on the holder the power of eminent domain, and exemptees are subject to fish and wildlife conditions imposed by federal and state fish and wildlife agencies.

Relicensing. Our licensing workload continues to be affected by the 157 relicense applications for projects whose licenses expired in 1993. Throughout the processing of each relicense application, we ensure agency and public participation and open and thorough environmental reviews. Relicensing has brought many participants to our proceedings who raise a wide variety of issues. We address new and difficult questions on project design, operational changes, and the balancing of competing interests. Although we expect to complete processing the majority of these 157 relicense applications by the end of FY 1996, work on some cases will continue into FY 1997 because of difficulties encountered in resolving very contentious issues. As we complete work on these cases, we will focus more on the pending relicense applications for licenses that expired or will expire in other years, using experience gained with increased public and agency participation and in handling issues associated with the group of 157.

Original Licensing. As we reduce our pending relicensing workload, we will devote more time and effort to applications for original licenses. Our original licensing actions enable undeveloped, renewable power to be harnessed, and provide opportunities for recreation and other public benefits. The process for these applications is very similar to the one used for relicense applications. By the end of FY 1997, we expect to significantly reduce the number of pending original major license applications. In processing these applications we address cumulative as well as site-specific resource issues.

Increased Prefiling and Postfiling Staff Involvement. Federal and state agencies, Native American tribes, and the public can and do participate extensively in the licensing process. This participation begins as early as three years before a license application is filed, when the potential hydropower developer follows the prefiling consultation requirements in our regulations.

These consultation requirements ensure that an applicant considers the broad range of key environmental, engineering, and economic factors in preparing an application. The studies conducted by the applicant help us evaluate the proposal and expedite processing once we receive the application.

Commission staff will continue to be involved throughout the pre- and post-application filing periods. They will, if appropriate, attend meetings among applicants, agencies, and the public during the first

and second stages of prefiling consultation to help resolve disputes and facilitate the preparation of acceptable license and relicense applications. We expect to substantially shorten the processing time for such applications.

Environmental Requirements. Federal statutes mandate that we consider and mitigate environmental impacts of hydropower projects. We independently analyze likely environmental effects of proposed hydropower development and proposed changes to existing projects.

To meet these requirements, we prepare environmental assessments (EAs) and environmental impact statements (EISs) or supervise their preparation by contractors. To ensure that we examine all important environmental issues, we go through a public scoping process for all license and relicense applications and appropriate post-license amendments. Both EAs and EISs become part of the Commission's record used to approve or deny licenses, relicenses, and exemptions. These procedures help ensure appropriate development of the Nation's hydropower resources, giving equal consideration to environmental values.

Commission staff also reviews every license and relicense application in accordance with the comprehensive development standard of Section 10(a)(1) of the FPA. We evaluate the potential for proposed or existing projects, in combination with other developments in a basin, to create beneficial or adverse impacts. NEPA documents for projects in the same basin are linked so we can process pending cases quickly and comprehensively. We also review the need to reopen existing licenses for possible amendment proceedings related to cumulative impacts.

The FPA requires that we build a record that includes analyses of proposed projects' consistency with comprehensive plans prepared by federal or state agencies. To date, approximately 660 plans have been filed, and federal and state planning and resource agencies continue to file additional plans.

Under the Endangered Species Act, the Commission must ensure that licensed and exempted projects do not jeopardize the existence of endangered or threatened species or destroy or adversely modify critical habitat. With over 950 species now listed, and about 300 more for which listing appears warranted, potential conflicts at proposed, licensed, and exempted projects are expected to increase dramatically. Endangered species issues require extensive analysis, as well as consultation with resource agencies, to reach resolution.

The Supreme Court's 1994 decision in *PUD No. 1 of Jefferson County v. Washington Department of Ecology* broadly construed the ability of the states to impose conditions on hydropower licenses, pursuant to Section 401 of the Clean Water Act. This decision has increased the states' ability to impose on hydropower projects conditions affecting flow and other issues.

Third-Party Contracting. The Energy Policy Act (EPAct) authorized the Commission to allow applicants — at their election — to employ outside contractors to prepare environmental documents. The third-party contracting authority can be used by those applicants wishing to fund the preparation

of the environmental document during the prefiling stage of a license application. The EPAct authority is limited to applications filed after October 24, 1992, the date of enactment. However, in response to a Commission request, the Office of Management and Budget clarified that the Commission may implement a voluntary third-party contracting program for *all* applications.

Several projects are in the very early stages of the third-party contract process. We expect a lower level of third-party contract activity in FY 1997, because of the applicants' risk in committing significant financial resources during the prefiling process, except possibly in relicensing cases where additional capacity is proposed.

If the provisions of the third-party contracting authority are used routinely by applicants, there could be a reduced need for contract funds in the future. However, we do not know the extent to which third-party contracting will be requested by applicants.

Interagency Cooperation. Under Section 10(j) of the FPA, we must include in all hydropower licenses specific conditions to protect, mitigate damages to, and enhance fish and wildlife resources. We must base the conditions on recommendations from fish and wildlife agencies under the Fish and Wildlife Coordination Act. In FY 1997, we expect to conduct 32 Section 10(j) processes. In this process, we:

- review fish and wildlife recommendations;
- make a preliminary determination of any inconsistency between fish and wildlife recommendations and applicable law (including notifying all parties of the determination);
- obtain responses of interested parties; and
- hold meetings at our discretion or as requested by any interested party within 75 days of a preliminary determination.

During FY 1997, we will continue to expand our cooperation with federal and state resource agencies to reduce needless duplication and processing time for environmental reviews.

Dam Safety and Inspections

We are responsible for inspecting approximately 2,600 dams and related water retention structures. These are dams under license or exemption and dams at projects we have found to need a license or exemption. Our dam safety program complies with the Federal Guidelines for Dam Safety issued under a Presidential Executive Order. We developed our dam safety program to ensure that the dams under our jurisdiction are properly constructed, operated, and maintained. We review all new license, original license, and exemption applications that involve existing dams to evaluate dam and project safety.

Over two-thirds of dams that are required to be licensed are more than 50 years old. As dams age, concern over their safety and integrity grows. Therefore, project oversight and a periodic inspection program are extremely important.

Our periodic inspections verify the structural integrity of dams. They identify necessary maintenance and remedial modifications. Inspections during project construction (1) ensure that the project, as actually built, complies with the approved design, (2) aid in the discovery of unexpected conditions (such as unknown foundation features), and (3) provide staff an opportunity to determine whether design changes are necessary. Inspections also ensure that projects get the maintenance they need and help ensure that licensees comply with license provisions. Inspections safeguard the continued operation of projects, which enables them to continue to produce a variety of multipurpose benefits.

Through inspections we identify safety problems at projects before they lead to dam failure or jeopardize public safety. This aspect of the program:

- prevents the loss of life and property damage;
- identifies maintenance needed to avoid dam safety problems;
- maintains electrical capacity and energy production;
- safeguards water for domestic, industrial, and irrigation use;
- ensures flood control capabilities;
- protects the environmental values of the project; and
- protects the public's safety during recreational activities.

We conduct periodic inspections from the time we receive an application for a proposed project through project operation. These include prelicense, construction, operation, exemption, public safety, special, and independent consultant inspections. We also make unscheduled inspections to investigate potential dam safety problems, unlicensed projects, complaints about the construction and operation of projects, safety concerns related to natural disasters, and compliance issues.

In addition, economic and environmental concerns have increased the need for more frequent surveillance of low hazard potential dams. While failure of a low hazard potential dam presents a low potential risk to life and property, experience has demonstrated that incidents at these dams can cause significant economic and environmental impacts.

Environmental and Public Use Inspections. The reservoirs at non-federal hydropower projects provide extensive recreational opportunities for the general public. Recent estimates show that about

100 million recreation-visitor-days are spent each year at licensed and exempted projects. The safe use of the projects by the public is an important Commission concern.

Environmental specialists conduct environmental and public use inspections of projects with major recreational developments. The focus of the inspections is protection of the environmental resources, ensuring that the recreational facilities are operated safely, and confirming that the project is in compliance with the environmental and public safety requirements of the license or exemption.

Periodic Inspection by Independent Consultant. Commission regulations require that an independent consultant inspect and evaluate all major licensed and exempted dams every five years. The consultants conduct site inspections as well as evaluate or confirm the adequacy of the spillway capacity and structural stability of the dam. We use the results in conjunction with annual inspections to ensure the safe operation of the project.

Dam Safety Engineering Evaluations and Studies. Our dam safety program requires engineering reviews, evaluations, and studies during construction, operation and maintenance of dams and related facilities to ensure their long-term structural integrity. These include:

- review of plans and specifications for new project construction, major dam safety modifications, and repairs;
- engineering evaluations to ensure dam safety under all potential loading conditions, including predicted seismic and hydrologic events;
- review of design analyses for dam safety improvements;
- review of requests for exemption from the requirements for emergency action plans and independent consultant inspections; and
- engineering evaluation of significant hazard potential projects.

Determining the impact on dams of natural disasters, such as earthquakes and floods, is an important and continuing effort. As we obtain and analyze better information on seismicity and hydrology, we will continue to develop state-of-the-art procedures for evaluating dams. Dam safety and inspections staff will direct dam owners to conduct the necessary studies at each stage of the work.

Earthquakes, like the one in California in late 1993, yield valuable information that can be applied to dam construction. We will apply this information when investigating and analyzing embankment dams constructed by hydraulic fill methods and those founded on loose, potentially unstable soils. In addition, we evaluate floods, such as the one in Georgia last year, to determine whether we need to make changes to our procedures for analyzing dams under flood conditions.

The criteria used in, and the analytical approach applied to, dam safety evaluations are important elements of a sound dam safety program. To provide guidance to our engineering staff and dam owners and their consultants, we publish *Engineering Guidelines for the Evaluation of Hydropower Projects*. We expect to publish additional chapters to *Engineering Guidelines* on such matters as arch dams, water conveyance facilities (penstocks, canals, and other conduits), other dams not presently included in the guidelines, and roller compacted concrete dams.

Emergency Action Plan Reviews and Tests. Since 1981, we have required licensees and exemptees to submit an Emergency Action Plan (EAP) for projects found to have the potential for the loss of life and property in the event of dam failure. After the regional office reviews and approves the plan, the licensee or exemptee updates the plan annually. Every five years, licensees must update and refile the plans. This includes coordinating with state and local emergency preparedness agencies. This program also assists the state and local emergency preparedness agencies in testing and improving their own emergency plans to fulfill their responsibilities, thus increasing the ability to save lives under emergency conditions. We verify that plans are current during our periodic inspections.

In addition to an annual test consisting of notification of all necessary entities in case of a project emergency, each licensee is required to conduct a functional exercise of an EAP every five years to test the readiness of licensee personnel and to involve state and local emergency preparedness agencies responsible for evacuation. These exercises are consistent with the national policy guidance of the Federal Emergency Management Agency on emergency preparedness regarding natural disasters. The effectiveness of emergency planning is a critical element in any overall dam safety program.

Dam Safety Modifications. Our staff identifies the need for a dam safety modification through inspection and evaluation, an analysis of an independent consultant's report, or on the basis of an owner's analysis. We base modification decisions on field investigations, laboratory tests, and engineering analyses in accordance with our *Engineering Guidelines*, and review any further investigations and analyses to solve the problem. After approving a design for a modification, we inspect the actual work. These inspections ensure the use of approved construction methods, ensure that the construction conforms to the design, and help us determine if site conditions warrant changes in design or construction methods. Project operators may need modifications to:

- increase the capacity of spillways to handle floods;
- provide overtopping protection for embankments during unusual flood events;
- repair weathered concrete, particularly at slab and buttress dams;
- repair embankment dams subject to liquefaction resulting from seismic activity; and

- improve the structural stability of dams, especially those on complex foundations with weak geologic features.

Project Compliance and Administration

We monitor and investigate compliance with the FPA, Commission regulations and orders, and the terms and conditions of more than 1,800 licenses, exemptions and preliminary permits. Meeting requirements for dam safety, public safety, and environmental reviews protects life, health, property, and the environment. We make sure licensees and exemptees comply with our policies to realize the multipurpose benefits of water resource developments.

The compliance program includes investigating actual incidents or allegations of noncompliance with our requirements; ensuring that our decisions are based on sound technical, environmental, and engineering analyses; and taking actions to resolve instances of noncompliance. When compliance violations merit assessments of civil penalties, we prepare notices of proposed penalty, assessment orders, and settlement agreements. We also evaluate project compliance to see what license conditions or changes are necessary during the relicensing process to reduce compliance problems.

Compliance Monitoring. All licenses and exemptions contain conditions regarding the construction and operation of hydropower projects to meet environmental protection and public safety requirements. Monitoring compliance with the complex terms and conditions in the large number of licenses and exemptions we issued in the 1980s continues to be a significant part of the compliance workload. Moreover, as we act on the 157 relicense applications from projects whose licenses expired in 1993, the project compliance and administration workload will swell because of the many post-licensing filings needed to meet procedural, structural, operational, environmental, and other requirements of the relicenses.

Our compliance staff maintains regular contact with licensees, exemptees, federal and state agencies, and environmental organizations. This improves communication and ensures better compliance monitoring.

We initiate a compliance action when a licensee or exemptee does not:

- construct the project as specified within the required time frame;
- operate the project within the requirements of the authorization;
- maintain the project as required by the FPA and our rules and regulations; or
- perform other actions we have required.

Compliance Actions. As part of our compliance efforts, we:

- issue overdue action letters for items that are more than 30 days overdue, advising the licensee that (1) it is in violation, and (2) it should submit the items or request an extension of time;
- issue to licensees letters of inquiry regarding concerns or complaints and require the licensee to respond;
- issue directives that (1) require licensees to immediately perform actions, and (2) may notify licensees that they are in violation and subject to penalty or other enforcement actions;
- issue compliance orders pursuant to Section 31(a) of the FPA when licensees have received proper notice and have failed to comply;
- revoke licenses and exemptions for violations of final orders; and
- assess civil penalties.

Hydropower License Compliance Tracking System (HLCTS). Automation has improved our compliance efforts. The HLCTS documents every filing requirement of each license, exemption, and preliminary permit, and allows us to efficiently monitor compliance with our regulations and orders.

Compliance Audits. Compliance audits are field evaluations we conduct with multi-disciplinary teams. We tailor these teams for specific compliance problems. Compliance audits help licensees and holders of exemptions understand and comply with the requirements of their licenses and exemptions. This program initiative extends beyond the traditional regulatory posture of responding to filings and uses Commission expertise to help project owners comply with the conditions that protect significant resources.

License Transition Team. License transition teams are multi-disciplinary teams that meet with the owners of recently-licensed and relicensed projects and interested parties to ensure that the licensees clearly understand the many new terms and conditions of their licenses, and the steps needed for them to achieve and maintain compliance.

Compliance Liaison Activity. This program was established to work with licensees and exemptees of small projects. The focus of the program is to minimize compliance violations by providing an additional layer of support to those who need it the most, because of their inherent small operations and possible lack of disposable funds. We hope to achieve this goal by ensuring their understanding of all aspects of the license or the exemption, providing a Commission contact, and ultimately lowering their regulatory and administrative burden.

Unlicensed Constructed Projects. There are some operating hydropower projects that may need to be licensed in accordance with Section 23(b)(1) of the FPA. These unlicensed constructed projects may pose public safety and environmental concerns. We identify these projects through record searches and information from other federal and state agencies and individuals. Each unlicensed project requires investigation, including a site inspection, to determine whether licensing is required, in which case, we require the owner to apply for a license or exemption within a specified timeframe.

Headwater Benefits Studies. Section 10(f) of the FPA requires assessment of headwater benefits. Benefits are the additional hydropower production made possible by the regulation of streamflow by federal reservoirs and Commission-licensed projects located in the headwaters of river basins.

These studies, for which we use sophisticated computer models, determine the charges we levy against owners of hydropower projects deriving benefits from upstream federal projects. The owners of the downstream projects must pay for the benefits received, as well as for the costs of conducting the studies.

Headwater benefits assessments produce revenue that helps pay for federal water resource projects managed by the Corps of Engineers, the Bureau of Reclamation, and the Bonneville Power Administration. In FY 1997, we expect to generate $7 million in revenue from annual headwater benefits bills and complete eight initial headwater benefits determinations that should provide additional revenue to the U.S. Treasury of about $5 million. We also expect to begin five additional headwater benefits investigations.

Post-Licensing Amendments. The significant rise in demand for water resources over the past several years has substantially increased requests to modify licensed hydropower projects. Modification requests from licensees, members of the public, and resource agencies commonly entail changes to project structures or operations to protect or enhance a variety of important environmental resources. Through reopener articles in the licenses, the Commission reserves authority to require, after notice and opportunity for hearing, such changes when warranted.

Regional Compliance Staff Presence. We will determine how best to develop a specialized staff presence in the regional offices. Staff will be placed where local issues and regional concerns warrant continued, significant staff involvement on resource issues involving multiple projects, cumulative impact analyses, and the coordination of Commission regional responses to Endangered Species Act requirements.

Such issues include implementing major fish restoration programs, such as the ongoing Atlantic salmon restoration program in the Northeast, and addressing the dramatic declines in the anadromous fish stocks in the Pacific Northwest. Current anadromous fish stocks in rivers and tributaries from Northern California to Washington State are a fraction of historical levels, which has resulted in continuing petitions to list these fish species as threatened or endangered. The listing of three salmon

species in the Columbia/Snake River basin alone has caused unprecedented impacts to hydropower production in that basin, with generation loss estimated in the millions of dollars. There are over 60 more fish species under consideration for possible listing in the Northwest alone. This undoubtedly will have significant impacts on non-federal hydropower development.

Competition for limited water resources is similarly evidenced by such proceedings as the San Francisco Bay Delta proceeding. This proceeding involves potential reallocation of water resources from various uses, including municipal, irrigation, and hydropower, to enhance the Bay ecosystem. Over 150 projects are potentially affected by the Bay proceeding.

The substantial increase in population in the southeastern part of the country creates ever-increasing demands for water supplies, which are frequently sought from large-volume reservoirs created by non-federal hydropower developments under license. As the water supply demands increase, conflicts between competing uses and users materialize.

Summary of Hydropower Workload and Resource Needs

FY 1997 will be a transition year for workload in the hydropower program. The general shift will be away from relicensing, which has been our focus for several years, toward increased post-licensing activities involving license administration, compliance, and dam safety matters. This will necessitate transferring staff from licensing to compliance and dam safety activities. We anticipate shifting personnel in FY 1996; by FY 1997 the transfer of staff from licensing to compliance will enable the Commission to respond to the growing post-licensing workload. By the end of FY 1997, we expect to have completed the 157 relicense applications from projects whose licenses expired in 1993.

Hydropower Licensing. We expect a significant reduction in the pending relicensing workload by the end of FY 1997 due to the completion of many pending relicensing cases. The continued use of contractor support has supplemented staff work while accommodating the need to conduct thorough environmental analyses to meet ECPA and NEPA requirements.

In FY 1997, we expect to prepare 35 NEPA documents for 57 license or relicense applications. Many of these applications raise complex issues that will require an EIS. We plan to complete 3 EISs encompassing 26 projects proposed in areas within defined river basins.

We expect the number of applications for new capacity hydropower projects to remain relatively low. However, these applications will continue to raise new and difficult engineering, environmental, economic, and legal issues. These issues will require us to address a number of policy questions in balancing conflicting resource considerations and finding site-specific and basin-wide solutions to licensing proposals.

The FY 1997 budget request also supports a continuing staff effort to help applicants — as well as federal, state, and local resource agencies — to better understand the Commission's licensing requirements. This will include more frequent staff attendance at meetings in the project area to assist applicants in substantially completing NEPA documents prior to license applications being filed.

Dam Safety and Inspections. Total inspection workload will remain high in FY 1997. The increased number of terms and conditions contained in newly-issued relicenses has expanded, and will continue to expand, the time required to complete project inspections.

We plan to conduct in-depth dam safety evaluations on the structural integrity of approximately 600 major hydropower projects. We will also conduct about 2,600 dam safety inspections, review 165 independent consultant inspection reports (Part 12 reviews), and conduct 350 environmental and public use inspections. This workload is extremely important and will require continuing high levels of staff attention, because: (1) dams are aging, (2) new techniques identify hazards sooner and more accurately, (3) new seismic data will require updated evaluations, and (4) improvements in determining maximum hydrologic events will require re-evaluations of spillway designs and hazard potential ratings of dams. This budget request includes contract funds for recognized experts who will help conduct the analyses required for complex dam structures, and develop necessary remedies to assure structural integrity.

We expect dam safety modification workload to remain high through FY 1997, as improved dam safety instrumentation programs help identify problems in aging dam structures. Contractor support will supplement staff resources in the area of dam safety modifications. This support includes dam safety research and analysis to provide the program with the latest techniques needed to identify and resolve seismic, hydrologic, and geotechnical problems, and to develop improved analytical tools.

Beyond project-related workload, we will expand our participation in the dam safety community to develop improved technical tools and procedures for analyzing the stability and adequacy of dams and determining economical remedial measures. This will include more interaction with other federal agencies and technical groups to coordinate improvements to dam safety programs in the U.S.

To more accurately portray the type and amount of work we do in this area, we have revised our tracking of dam inspections in the workload tables, Appendix A. Prior to FY 1995, inspection counts were based on the number of developments within a project that were inspected. Some developments have multiple dams that were previously counted as one dam. Since the beginning of FY 1995, each dam (rather than each development) is counted as one dam. This enables us to more precisely schedule and track inspections for each dam based on the differing inspection frequencies for high, significant, and low hazard dams. The staff resources required are not affected by this counting change.

Compliance and Administration. Filings of environmental amendments and environmental compliance actions will increase in FY 1996. Both of these categories of work require high levels

of staff resources. This increased activity is caused by: (1) the large number of licenses we issued in the 1980s; (2) the increased number of conditions included in licenses, particularly those related to environmental protection, mitigation, and enhancement; (3) the new licenses the Commission will have issued from the large number of relicense applications; (4) the need to ensure consistency with a basin-wide comprehensive development standard; and (5) the likely need to employ reopener articles to address emerging environmental issues.

Relicenses issued in FY 1995 and FY 1996 will place greater emphasis on environmental mitigation and enhancement. Additional staff resources are required not only to handle the additional license article requirements, but also to manage other requirements incorporated by the license, such as memoranda of understanding and settlement agreements, which usually contain extensive stipulations. More partnership activities, such as compliance audits, license transition teams, and liaison work will be undertaken in FY 1996 and FY 1997 to help maintain compliance. Activities such as these are expanding the role and duties of license administration and require resources above those needed to process the docketed workload. These new licenses will also identify environmental issues that will need to be addressed at other existing projects. Ultimately, we will ensure that all projects regulated by the Commission comply with the comprehensive development requirements of the FPA throughout the terms of their licenses or exemptions.

We will complete headwater benefits investigations that we have targeted for priority action to ensure that appropriate revenue continues to flow into the U.S. Treasury as compensation for the benefits that our licensees derive from upstream federal improvements.

SUMMARY HYDROPOWER WORKLOAD

Receipts

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Hydropower Licensing	218	138	153
Dam Safety and Inspections	3,784	3,811	3,777
Project Compliance and Administration	2,406	2,276	2,380

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Request
FUNDING	$68,554	$64,356	$59,806
FTEs	609	585	533

NOTE: As directed by the Congress, the Commission is reducing staffing to 533 FTEs by FY 1997, a 20% reduction from the FY 1995 authorized level of 666. The FY 1995 actual level shown above reflects the progress we have made thus far.

Overview

In the natural gas and oil pipelines program, our regulatory philosophy and efforts are focused on the continued development and enhancement of competition through open-access transportation. The gas and oil program has changed dramatically and continues to evolve as market opportunities grow. To meet these challenges, the Commission has the continuing role of shepherding and leading the industry toward a more competitive environment.

As directed by the Congress, we are reducing overall staffing in the natural gas and oil pipelines program to 533 full-time equivalents (FTEs) by the end of FY 1997, a 20 percent reduction from the FY 1995 authorized level of 666 FTEs, with a comparable reduction in requested funding.

The new resource levels will provide an adequate level of staff and funding to meet program goals and objectives, with increased focus on creating solutions and nurturing an environment to further competition. While our traditional, routine workload has decreased in the more ministerial areas, with an accompanying decrease in staffing levels, the Commission requires a highly trained technical staff that is able to provide the guidance and advice necessary to process the complex workload the Commission is experiencing. It is noted that even with anticipated gains in efficiency in workload processing and adjustments to staff and workload assignments, the 20 percent reduction in staff will result in an increase of pending workload in some areas. Resources will be focused first on workload with statutorily imposed deadlines.

As noted, the Commission has a vital role to play in the new natural gas marketplace. Further reductions would endanger our ability to respond to the industry's needs in a timely fashion.

Our activities include several elements:

- We actively work with all segments of these industries to pursue regulatory initiatives leading to greater competition and flexibility for ratepayers.

- We develop policies and solutions to meet and deal with emerging industry opportunities such as the use of market-based, negotiated, incentive, or other rate mechanisms, while we continue to look at new ways to improve traditional ratemaking techniques. We also develop unique and creative methods and policies, dealing with such fluid issues as the treatment of unbundled gathering services, potential revisions to the capacity release program, cost recovery possibilities for stranded upstream pipeline capacity, and the treatment of production area costs in an unbundled market.

- We analyze and act on filings reflecting industry responses to such initiatives as market-based rates, negotiated rates, incentive rates, and other nontraditional proposals.

- We facilitate the resolution of disputes involving tariff, rate, and miscellaneous service issues through an informal resolution process.

In addition, we analyze and act on more traditional filings involving the following requests and concerns:

- proposals to authorize, change, or abandon transportation, storage, or exchange of natural gas services;

- requests to site, construct, and operate facilities used to provide such services and for the import and export of natural gas;

- the environmental impact of, and the need for, the proposed service or facility;

- proposals for initial rates and subsequent changes to rates, including full rate cases involving all elements and costs of providing service, and limited rate cases involving only certain costs and services;

- filings involving tariff modifications to change services offered and to reflect changes in operational requirements, the tracking of specific cost items, compliance with Commission orders, and proposals requesting additional tracking or flowthrough authority; and

- general oil tariff and rate change filings.

The decrease in total workload numbers for the natural gas and oil pipelines program reflected in FY 1996 is carried over to FY 1997. This decrease is primarily due to a reduction in the

transportation transactions filings. From receipts of 3,615 in FY 1995, these filings are expected to drop to zero in FY 1996 and FY 1997. Elimination of these reports is part of the Commission's effort to reduce unnecessary filing requirements. While this reduction in the number of filings is substantial, the impact on staffing and workload will be minimal. Processing of these filings has always been ministerial and required very little staff analysis, with no more than three FTEs being allocated to this task in the past.

In keeping with the goals of reducing the filing burden on the industry and increasing accessibility to the users of this information, we are expanding our efforts on electronic filing. In the gas pipeline area, we are requiring that the majority of the filings and associated information be filed electronically over the next 12 months.

This effort will require upfront expenditures by the Commission to enable it to receive the electronic filings and to process the information to make it available to staff in a usable form via the Commission's computer network. These expenditures will also allow the electronically filed materials to be made available to the public via the Commission's electronic bulletin board service. The electronically filed data will be available faster and to multiple users simultaneously, and will eliminate much manual extraction and entering of data, resulting in more efficient and effective analysis by all parties.

FY 1995 and FY 1996 Achievements

In FY 1995, we issued several notices of inquiry, proposed rulemakings and final rules that reflect our vision as to how the post-Order No. 636 environment should work. We also issued notices of proposed rulemaking to revise, reduce, and update gas regulations and reporting requirements, including the manner and content of electronic filings to reflect the changes to regulatory information requirements in the post-Order No. 636 setting. Aside from reforming our past regulatory approach to gas transportation regulation, the revisions reflect our efforts to increase efficiencies and streamline proceedings. With a view toward reforming our regulatory approach, we sought industry input on alternatives to traditional cost-of-service ratemaking for natural gas pipelines, such as market-based rates and incentive regulation.

In FY 1995, in the area of rulemakings and policy statements, we:

- finalized the standards of conduct and reporting requirements for transportation and affiliate transactions in Order No. 566-A;

- issued a notice of proposed rulemaking and a final rule to modify the capacity release program to lessen administrative burdens on the industry by allowing pre-arranged deals to be transacted for an entire calendar month;

- issued a notice of proposed rulemaking implementing revisions to the Uniform System of Accounts, and to forms, statements, and reporting requirements for natural gas companies to recognize changes in the services provided by pipelines subsequent to the issuance of Order No. 636;

- issued a notice of proposed rulemaking on streamlining and reforming filing and reporting requirements of interstate natural gas company rate schedules and tariffs;

- as required by the above notices of proposed rulemakings, held a technical conference on the revisions and updating of the gas filing and reporting requirements so as to begin the process of modifying electronic filing and the forms filing requirements;

- convened a public conference to consider the status of electronic communications of operating and business information within the natural gas industry;

- issued a policy statement on the rate treatment for the cost of new pipeline construction;

- prepared a staff white paper on alternatives to cost-of-service ratemaking methodologies and issued it for public comment;

- issued final rules for oil pipelines on cost-of-service ratemaking, annual reporting requirements, and market-based ratemaking as alternative methods to the index-ratemaking methodology; and

- issued a notice of proposed rulemaking to exempt oil pipelines with minimal jurisdictional revenues from filing Form No. 6 and paying annual charges to the Commission.

To date in FY 1996, we have continued building on our efforts started in FY 1995 relating to ratemaking methods for the future, as well as started efforts for dealing with other post-Order No. 636 concerns facing the industry. To this end we have issued several additional final rules or policy statements.

In FY 1996 to date, in the area of rulemakings and policy statements, we:

- issued the final rule implementing the revisions to the Uniform System of Accounts, and to forms, statements, and reporting requirements for natural gas companies;

- issued the final rule streamlining and reforming the filing and reporting requirements of interstate natural gas company rate schedules and tariffs;

- conducted working group meetings with participants from all facets of the natural gas industry pursuant to the requirements in the final rules to work out mutually agreeable electronic filing specifications for pipeline informational filings, forms filings, and rate filings;

- issued a policy statement on alternatives to cost-of-service regulation for gas pipelines permitting use of negotiated rates with a recourse cost-of-service rate, revising the criteria for evaluation of incentive ratemaking proposals, and enunciating the determinations the Commission will make with regard to market power prior to allowing the use of market-based rates;

- instituted a rulemaking to consider further industry comment on the use of negotiated terms and conditions in conjunction with negotiated rates with a recourse rate;

- acted on the recommendations to speed up standardization of electronic communication by issuing an advanced notice of proposed rulemaking requesting input from the industry, particularly the Gas Industry Standards Board, on what standardized practices to require;

- issued a notice of inquiry for public comment and a subsequent policy statement on the regulatory status of pipelines on the Outer Continental Shelf, finding a presumption of nonjurisdictional gathering for facilities outside 200 meters offshore and continuing the application of the current criteria, known as the modified Farmland test, for facilities within 200 meters offshore; and

- issued a declaratory order establishing the Commission's policy allowing natural gas pipelines to acquire capacity on other pipelines.

As part of our efforts to make information readily available to the public in a user-friendly mode, we instituted the Gas Pipeline Data electronic bulletin board. Anyone with a computer, modem, and phone can access and download data from our bulletin boards without cost, or for the cost of a long distance phone call. The Gas Pipeline Data bulletin board contains current and historical tariffs for all regulated companies, all data from electronically filed forms, and the environmental guidelines for proposed pipeline construction projects.

The natural gas industry has been adjusting to the restructured business environment of Order No. 636. The program we have put in place appears to be highly successful. Transportation and supply alternatives have increased dramatically and prices have generally fallen without jeopardizing the reliability of natural gas service. We are assessing the success of the mandates of Order No. 636 using the first year reports on operations of the pipelines under Order No. 636 and conducting oversight of the industry.

As a result of industry oversight, we have been able to evaluate capacity availability, throughput, competition among buyers and sellers, increasing levels of transportation and consumption, use of

the capacity release program, use of storage facilities, the frequency of service interruptions, and other operational issues. Any problems found were generally unique to individual pipelines. In some instances we took steps to resolve these pipeline-specific problems by fine-tuning certain elements of our restructuring requirements, where necessary, to recognize the unique operating characteristics of each pipeline. In other cases, the pipelines made filings proposing operational changes, changes to services offered, or changes in their tariff terms and conditions. These changes were evaluated and either authorized, rejected, or modified.

Areas of increasing interest in the gas pipeline industry, and for regulated companies generally, are market-based ratemaking, negotiated ratemaking, incentive ratemaking, or a combination of market-based/incentive rates and cost-of-service rates. In order to become well-informed on the industry's concerns, both from the pipelines' and consumers' viewpoints, we issued a staff white paper on this issue. We solicited comments from all interested parties, and used those comments to formulate a statement of policy as to the Commission's regulatory approach to alternative ratemaking proposals made by the natural gas pipelines. We have also established a new rulemaking docket to solicit further comments on the possibility of permitting negotiation of terms and conditions of service between pipelines and their customers. To date, we have permitted market-based rates in certain limited cases for new, small gas storage projects that clearly lacked market power. Also, in the oil pipeline arena, we have had several fully litigated market power cases and have permitted market-based rates on segments of two oil pipelines.

The capacity release program established by Order No. 636 was also the focus of much attention by the industry and the Commission. Various parties raised concerns about the operation of the program. Thus, in order to fully investigate the concerns, we initiated a series of 19 outreach meetings with all segments of the natural gas industry. We used the comments from these meetings to quickly propose, and then issue, a final rule to improve the program.

In FY 1995, we have continued to process a significant number of filings by pipeline companies to recover transition costs resulting from Order No. 636. In these cases in particular, we have made significant progress in using ADR techniques to resolve the often contentious proceedings. In many cases we have established conferences and facilitated resolutions of the issues.

The Commission convened a public conference to consider the current state and future development of electronic communication within the natural gas industry. During the conference the Commission solicited views on the current state of operations of the pipelines' electronic bulletin boards, the advisability of developing standards for the electronic bulletin boards, the progress being made in standardizing information contained on the boards, and how the Commission should be involved in the process.

The Commission issued a declaratory order to clarify its policy regarding pipelines holding capacity on other pipelines. The Commission stated it would examine proposals to acquire such capacity on a case-by-case basis.

With pipeline restructuring largely completed, we were able to also focus attention on reforms to our certificate program. We took two important steps. First, we began a comprehensive review of our certificate regulations, targeting those that merit elimination or modification. Our goal in this process is to reduce burdensome and unnecessary requirements and heighten focus on those that are material to a public interest determination. Second, in order to give more certainty to sponsors of pipeline construction projects (and their potential markets), we issued a policy statement on the pricing of new construction. The policy provides a mechanism for an up-front determination, in the certificate proceeding, of the rate treatment likely to be applied to the project.

Consumer Protection — Rates. To protect consumers from unjust and unreasonable rates, as mandated by the Natural Gas Act (NGA) for gas rates and by the Interstate Commerce Act for oil pipeline rates, we:

- acted on 17 general NGA Section 4 gas rate applications in FY 1995, and 4 to date in FY 1996, involving cost of service, rate allocation, depreciation, rate of return, and other issues;
- acted on 1,189 limited NGA Section 4 gas rate filings in FY 1995 and 400 to date in FY 1996 — composed mostly of filings to recover remaining take-or-pay costs, transition costs related to the implementation of Order No. 636, including Account No. 191 close-out direct bills, gas supply realignment costs, and costs associated with unneeded upstream capacity — plus cost-tracking filings, tariff language changes relating to services or operational terms and conditions, and all associated compliance filings;
- authorized 567 oil pipeline rate tariff filings in FY 1995 and 205 to date in FY 1996;
- analyzed responses to approximately 100 requests in FY 1995, and 40 to date in FY 1996, for information to expedite the review of rate and tariff change proposals and avoid time-consuming administrative procedures, such as litigation;
- served initial settlement offers to the parties in 15 litigated rate cases in FY 1995 and in 5 cases to date in FY 1996;
- served testimony in 14 litigated cases in FY 1995 and in 7 to date in FY 1996;
- performed approximately 60 field audits in litigated rate cases in FY 1995 and 20 to date in FY 1996;
- issued 8 Commission opinions on initial decisions in gas pipeline proceedings in FY 1995 and 1 to date in FY 1996;

- issued Commission opinions on 3 non-Trans Alaska Pipeline System oil hearing initial decisions, thus completing 24 litigated oil pipeline dockets in FY 1995;

- resolved 2 appeals of Department of Energy (DOE) remedial orders concerning DOE's oil price regulation program in FY 1995; and

- completed the processing in FY 1995 of the last 55 refund cases involving Kansas ad valorem tax refunds, in order to close out the producer price regulation program.

Consumer Protection — Construction. To ensure that pipeline construction projects were in the public interest, we:

- approved, in FY 1995, case-specific gas pipeline construction projects or projects to operate facilities involving over 1,024 miles of gas pipeline, 165,000 horsepower of compression, 2.25 billion cubic feet of capacity per day, and $1.1 billion in potential investment, and in FY 1996 to date, over 268 miles of gas pipeline, 26,911 horsepower of compression, 1.2 billion cubic feet of capacity per day, and $204 million of potential investment;

- served over 200 data requests in FY 1995 to obtain information necessary to process these pipeline certificate applications and to resolve protests, and 70 to date in FY 1996;

- issued 13 preliminary determinations giving applicants early guidance on the non-environmental aspects of their gas pipeline construction proposals in FY 1995; and

- processed over 300 prior notice filings for gas pipelines in FY 1995 and 102 to date in FY 1996.

Environmental Protection. To ensure protection of the environment, we:

- conducted 287 construction site compliance inspections during both construction and restoration of the right-of-way and 1 on-site engineering audit in FY 1995, and 81 construction site inspections to date in FY 1996;

- conducted 9 LNG plant safety inspections in FY 1995 and 1 to date in FY 1996; and

- conducted 84 environmental assessments, 2 draft environmental impact statements, and 3 final environmental impact statements for gas pipeline construction in FY 1995, and 31 environmental assessments and 2 draft environmental impact statements to date in FY 1996.

In addition, we convened 8 industry outreach training sessions in FY 1995. These sessions covered pre- and post-certificate requirements to aid applicants in preparing complete applications concerning the Commission's environmental filing requirements. Specifically, sessions provided guidance on

environmental report preparation, construction environmental compliance, and cultural and historical resource requirements. Attendance averaged from about 30 individuals for the cultural seminars to about 100 individuals for the other seminars. Attendees consisted mostly of company representatives and consultants. These seminars were well received and we have received requests to conduct additional sessions.

To ease the burden of our environmental oversight, we:

- initiated procedures for third-party contracting for environmental documents to speed and improve the certificate process;

- permitted applicants to prepare environmental assessments themselves, which they may file with the applications to speed the review process; and

- reviewed requests for, and ultimately granted in FY 1995, 355 categorical exclusions from environmental assessments or impact statements where it was determined no significant impact on the environment would occur, and 134 to date in FY 1996.

Alternative Dispute Resolution. Our overall approach to resolving issues or cases has been to maximize the use of alternative dispute resolution (ADR). This took the form of informal technical conferences where parties aired their positions and, in many cases, resolutions were reached. If the problems were not resolved, position papers were filed to provide a complete record, and we were then able to decide many issues on the merits without the need for protracted litigated proceedings. As an example of the effectiveness of ADR measures, the Commission approved a settlement which resolved over 100 outstanding interrelated FERC cases and associated court cases involving Columbia Gas Transmission Corporation's bankruptcy proceeding. This settlement provided for the distribution of $7.5 billion to various creditors, and established the basis for Columbia to emerge from bankruptcy after four and one-half years of bankruptcy court protection.

In our effort to promote efficiency and to lessen the burden on all participants in proceedings, we used alternatives to formal litigation at every appropriate opportunity. In this regard, we:

- convened 64 technical conferences in FY 1995, and 15 to date in FY 1996, to resolve questions and concerns raised by the Commission or consumers related to rate and certificate proceedings; and

- acted on 76 natural gas and oil settlements in FY 1995 and 25 to date in FY 1996, including the following significant actions:

  - approved 3 full or partial settlements of gas rate proceedings, resulting in the completion of 143 outstanding dockets in FY 1995;

- approved 27 full or partial settlements of gas rate cases that had been set for hearing before the administrative law judges, resulting in the completion of 47 outstanding dockets in FY 1995, and 9 settlements of 11 dockets to date in FY 1996;

- approved 1 full or partial settlements of oil rate cases that had been set for hearing before the administrative law judges, thereby completing 1 outstanding docket in FY 1995, and 13 settlements of 70 dockets to date in FY 1996; and

- approved 4 settlements in FY 1995, and 2 to date in FY 1996, relating to the gas supply realignment transition cost filings of certain pipelines as a result of Order No. 636.

The natural gas and oil pipelines workload chart, beginning on page 83, reflects a more comprehensive breakdown of activities occurring in the program. This year, to more clearly portray the variety of work in this program, we have included additional workload categories. This change flows from the implementation of Order No. 636 and the FY 1994 reorganization of the technical program office, which have allowed a better delineation of workload responsibility. Additional categories involving prefiling conferences, public conferences, and other outreach activities are included in the workload and reflect the Commission's policies and philosophies of service through assisting the industry in crafting solutions and increased interaction with the industry.

FY 1996 and FY 1997 Program Issues

Order No. 636 totally restructured the interstate natural gas pipeline industry. Mere implementation of that order, however, does not insure the continued successful development of this new industry structure or satisfy the Commission's mandate under the NGA to ensure just and reasonable rates. The Commission is facing a variety of proposals from the industry setting forth new types of services, novel rate approaches, and ways to attract new markets. These filings are accompanied by requests for expedited handling by the Commission so that the industry is able to meet the fast changing requirements in the market place. At the same time, the Commission must be vigilant in ensuring that the pipelines are not wielding monopoly power over the transportation service to the detriment of the shippers, local distribution companies, and end users on the system. In order to further what we have started, we will:

- begin to analyze and process filings made pursuant to our policy statement on alternative ratemaking methodologies;

- analyze the comments received on negotiation of natural gas pipeline service terms and conditions in consideration of expanding the policy statement on allowed alternative ratemaking methodologies;

- apply criteria for market-based rate proposals where an applicant can show it lacks market power;

- review the current rate of return policy to ascertain whether it is appropriate in today's capital markets, or whether different approaches to evaluate risk, market analysis, and the choice of proxy companies would more accurately reflect the financing costs of the pipeline industry;

- examine issues and analyze policies relating to the treatment of production area rates;

- continue the Commission's efforts relating to standardization of electronic information interchange within the natural gas industry to simplify and improve market and operational transactions;

- monitor industry performance and its structural changes under Order No. 636, including the review of conditions imposed on storage service, operational balancing agreements, upstream capacity retention, bidding under the right of first refusal, and other issues raised in petitions or complaints before the Commission to insure anticipated results and to address new issues;

- develop policies to foster innovative service offerings by the pipeline industry to satisfy today's market structure and encourage growth in the use of natural gas;

- develop means of analyzing individual pipeline construction projects in light of the overall needs of the national integrated pipeline grid, rather than solely on the merits of an individual project;

- encourage development of new supply sources for end use markets, thus expanding natural gas use in the marketplace; and

- develop advanced computer applications and electronic databases for pipeline and industry data, including the capability to receive and use digitalized maps, graphics, and photographs, in order to enhance industry monitoring, increase accessibility of information to all interested parties, and enhance the operation and processes of the Commission.

Improving Existing Approaches. Even as we tackle future program issues, we must continue improving existing processes. We will continue to:

- reduce case processing times for both construction certificate and rate and tariff change applications;

- improve the quality and content of pipeline filings, particularly through the use of prefiling conferences for both the natural gas and oil pipeline areas;

- improve our consumer outreach program to increase public awareness of pipeline construction proceedings;
- evaluate the environmental filing procedures and requirements for gas pipeline construction projects to adapt to the restructuring of the industry;
- conduct industry training seminars on environmental compliance, environmental report preparation, and cultural and historical resource requirements, to assist applicants in preparing complete filings and to speed the processing of applications;
- eliminate unnecessary filing and reporting burdens to improve the usefulness and availability of the data collected;
- continue to encourage third-party contracting for environmental documents, to accelerate the application review process; and
- implement the rolled-in/incremental pricing policy for new construction, addressing issues as they arise during this process, and evaluating and acting on the expected increase in requests for declaratory orders.

General Rate Issues

As the natural gas industry matures under the new structure established by Order No. 636, we will face new issues as regulators. In light of the variety of options to obtain capacity now available — such as released capacity, interruptible capacity, short-term firm capacity, and storage — current contractual holders of firm transportation capacity will reassess the level of firm capacity they must hold. We anticipate that, as current contracts expire, the capacity holders will reduce the quantity of firm transportation capacity they hold. This will free capacity, creating interesting challenges for the pipelines, their customers, and the Commission.

Some market areas will have excess capacity. In these cases, the pipelines will need to aggressively market the freed capacity to new users along their systems and to work at increasing the general demand for gas as fuel or feedstock to assure utilization of the current capacity. The Commission has announced it will give considerable rate flexibility for pipelines seeking to market turned back capacity while protecting remaining customers. Further, we anticipate that pipeline marketing of freed capacity will affect the capacity release market and its operations.

Just as the need for existing capacity is declining in some market areas, it is expanding in others. New competitors may be able to deliver gas less expensively than traditional suppliers, and thus pipeline capacity utilization patterns will shift. This is the dynamic of an increasingly competitive, maturing marketplace. We are seeing new supply basins being developed such as on the Outer Continental

Shelf in the Gulf of Mexico, Sable Island off Nova Scotia, and in Western Canada as sources of gas for this new competition.

Coincidentally, the Commission is experiencing an increase in the number of certificate applications filed by the pipelines to reflect these new capacity utilization patterns and sources of supply. This increase is occurring throughout most of the regions in the country as pipelines are developing creative and specialized services to meet their customers' needs under the new market dynamic. For example, pipeline expansions are before the Commission in applications filed by: Columbia Gas Pipeline Corporation for markets in Ohio, Pennsylvania, Maryland, Virginia, and North Carolina; Northern Border Pipeline Company and Natural Gas Pipeline Company of America for increased capacity into the Chicago area; and Maritimes and Northeast Pipeline, L.L.P. for markets in New England. Phased construction is being discussed for TransColorado Gas Transmission Company to move San Juan supplies to Blanco, N.M., to interconnect with El Paso Natural Gas Company and Transwestern Pipeline Company.

The Commission, therefore, is facing capacity turnback issues in rate filings simultaneously with pipeline expansion issues in certificate applications. Reconciling the outcomes of these issues, particularly with regard to determining where the public interest lies, will pose significant challenges for the Commission and the industry.

In the short term, the Commission has begun the process of allowing pipelines to propose innovative rate techniques to ease the adjustments to the new capacity levels and to provide incentives to the pipelines to find new markets for the freed capacity. In the longer term, we will need to further enhance the ratemaking options to assist the industry in providing pricing and marketing flexibility to attract new long-term gas users.

The pipeline industry and financial analysts have recently focused on the perceived inadequacy of the rates of return granted the pipeline industry and the pipelines' resultant difficulty in competing for capital in the financial markets. In response, the Commission has started a review of its rate-of-return analysis to determine whether the criticisms are justified and, if so, what types of changes could be made.

The series of outreach meetings we held on capacity release provided us with information on a variety of issues related to the secondary transportation market. These issues include possible modification or elimination of the bidding process, changes to posting requirements, the permissibility of extended term direct deals, and possible modification or elimination of the cap on the release price. The Commission will review the capacity release program to determine whether any changes are warranted and, if so, the extent of the changes needed. We anticipate action on these issues in FY 1996.

We will also have to develop new methods to monitor pipeline rates and financial information filings to ensure that the last-approved rates, whether cost-based or otherwise, continue to be just and

reasonable, since pipelines are no longer required to make periodic, scheduled filings with the Commission.

Even while the Commission confronts new issues and new types of filings, we must continue to address existing issues and filings. Fuel-use tracking filings will continue under the new environment, as pipelines assess and seek to bill transportation costs to the appropriate parties. Other tracking filings, such as those to recover third-party pipeline transportation charges, will also continue to be filed as pipelines are able to shed unwanted upstream capacity.

Pipelines will continue to file limited NGA Section 4 cases for the recovery of transition costs. The resolution of issues that are currently being litigated will be applied to new filings. To the extent new issues arise in new filings, we will develop new policies or add issues to the ongoing formal proceedings. The Commission will continue to encourage voluntary settlements of these contentious proceedings.

Because of all the new issues the Commission will be facing, the filings and proposals will require more detailed, innovative, and in-depth analysis by well trained, versatile, and highly educated staff. While the absolute number of filings and proposals received by the Commission is expected to decrease, those that are received will be far more difficult to analyze, since they will not follow a structured format and, in many cases, will not have established precedent.

Certificates

Most of the routine activity subject to the certificate requirements of the NGA is now authorized under blanket certificates rather than through case-by-case review. Blanket certificate authority permits the certificate holder to install limited facilities and offer services, either on a self-implementing basis or after a notice period. The Commission monitors these activities through various compliance filings and reporting requirements.

Generic authorization of certain types of facilities, as opposed to a case-by-case approach, has two principal advantages. First, a generic approach reduces the burden on industry, allowing more timely construction of facilities and the initiation and cessation of services (market entry and exit) in response to market conditions. Second, it permits the Commission to concentrate its certificate resources more productively on those proceedings where case-specific analysis is required — such as major construction projects to provide new or increased transportation, storage and import/export services, and unique proposals involving novel forms of market responsive services, pipeline conversions, service restructurings, organizational realignments, and sale or transfer of pipeline facilities.

Also, in view of the industry's consolidation efforts, we expect to receive cases pertaining to jurisdictional issues, as the once distinct line between intrastate and interstate services becomes blurred. These types of cases will be contested and raise controversial and complex issues.

With the competition in the gas market becoming more international, the Commission is receiving more NGA Section 3 filings and related requests for Presidential permits to construct and operate border facilities to import and export gas. We are seeing requests to build related NGA Section 7 facilities for export of gas to serve Mexican and Canadian markets.

During FY 1997, we will continue our enhanced public information program on the pipeline construction environmental review process, which includes:

- local pre-construction notification, through notices of intent to prepare environmental documents and mailings to all landowners affected by pipeline activity on rights-of-way or elevated noise levels;
- public notification of local environmental scoping meetings on proposed projects;
- public notification of pre-construction site inspections on controversial projects conducted by the Commission staff and cooperating federal and state agencies;
- enhanced coordination with state agencies; and
- outreach programs to inform the industry and public of our environmental policies.

To address the public's environmental concerns, we continue to work on ways to enhance our communication with affected parties. Early identification of these environmental concerns translates into a reduction in the overall certificate processing time. We are also intensifying our on-site inspections during a project's construction and post-construction phases.

We will also continue to update and streamline our nonenvironmental review process for pipeline construction and operation certificates. This will give pipelines the ability to respond quickly to competitive market conditions. In FY 1997, we will continue to:

- ensure that proposals are complete and include market support, as defined by recent Commission orders, before processing begins;
- convene technical conferences, when necessary, soon after the comment periods for applications expire, to obtain additional needed data on the applications;
- schedule most preliminary determinations on new construction projects for disposition within 120 days after receipt of a complete application;
- address policy issues to provide regulatory certainty, while remaining sensitive to the individual circumstances of the applicant and parties in case-specific proceedings;

- expedite our review process to meet proposed in-service dates, while observing due process and all applicable environmental laws;
- develop procedures to assist new entrants into the natural gas market;
- target areas of certificate regulations for revision or elimination, while balancing public interest considerations with the goals of market responsibilities and more light-handed regulation; and
- use interdisciplinary teams to improve the quality of technical analysis and speed caseload processing.

Compliance/Oversight

Post-Certificate Conditions. These activities reflect our increased concern with environmental monitoring and compliance after certificate issuance. We will conduct both in-house reviews of required filings (paper compliance) and site inspections (field audits and on-site inspections).

We approve construction applications subject to certain conditions. Environmental assessments include, on average, more than 10 conditions, and environmental impact statements include, on average, nearly 50 conditions.

We conduct compliance site inspections during and after construction of a certificated pipeline project, sometimes with other federal, state, and local agencies. Site inspections require:

- conducting field reviews on most pipeline projects greater than two miles in length, and on pipelines or above-ground facilities in environmentally sensitive areas; and
- scheduling inspections during construction to monitor compliance with construction conditions, and after construction to monitor restoration.

When the inspection reveals noncompliance, such as damage to a resource or failure to adhere to the required construction or restoration procedures, we require the company to bring its project into compliance. Repeated or serious noncompliance may require stop-work orders or enforcement action. Certificate orders are conditioned to ensure protection of the environment during construction. After a determination that right-of-way restoration is proceeding satisfactorily, companies must receive written authorization from the Commission before starting service.

Pipeline Safety. The Department of Transportation (DOT) has the statutory responsibility to ensure that pipelines are safe. The Commission will continue to work cooperatively with DOT to enhance the pipeline safety program. The Commission has an effective memorandum of

understanding with DOT regarding respective responsibilities on safe and environmentally sound siting, design, construction, operation, and maintenance of natural gas transportation facilities.

LNG Operational Safety and Reliability Inspections. Through the memorandum of understanding with the DOT, we conduct liquified natural gas plant safety inspections in accordance with the NGA, which requires the assurance of a plant's operational reliability. We conduct these inspections on a biennial basis, so we can inspect all jurisdictional facilities every two years.

NGPA Section 311 Construction and Section 2.55 Replacements. Commission Order No. 544 requires pipelines to file advance notices and annual reports of construction activities undertaken pursuant to Section 311 of the Natural Gas Policy Act. Replacements of existing facilities are subject to the same requirements. Review of these notices and reports enables us to ensure that pipelines comply with all environmental requirements and to take follow-up action as required.

- Section 2.55 Replacement Filings Exceeding Cost Limits: Jurisdictional companies replacing natural gas facilities under 18 CFR 2.55 (b) must notify the Commission at least 30 days prior to commencing construction if the cost of the project exceeds a specified cost limit.

- Section 311 Construction Filings Exceeding Cost Limits: Pipelines contemplating construction activity related to NGPA Section 311 transportation must provide similar notice if the project exceeds the cost limit.

- For both Section 311 and Section 2.55 filings, site inspections are conducted on pipelines exceeding 2 miles in length and on those pipelines being constructed in environmentally sensitive areas.

For those projects that are exempt from the advance notice requirement, we require the filing of an annual report containing the same information required for an advance notification.

Blanket Annual Reports. This category covers environmental monitoring of compliance by those projects automatically authorized under blanket certificate authority and reporting annually under 18 CFR 157.207. These reports, among other things, allow the Commission to verify that pipelines are complying on their own with standard environmental conditions and keep the Commission informed on projects not subject to the prior notice requirement.

Refunds. When pipeline companies file proposed rate changes, they are usually accepted by the Commission, subject to refund. The Commission may order refunds at the end of the proceedings that determine the appropriate final rate.

Accounting and Financial Reporting. An essential element in the Commission's rate program continues to be the existence of reliable financial accounting information based on sound accounting principles applied to all jurisdictional companies. The Commission uses the accounting information

to establish just and reasonable rates under Sections 4 and 5 of the NGA, measure historic economic performance, assess compliance with the terms of accepted tariffs, determine the adequacy of current rates, and construct ratemaking models for the development of future rates.

A program of financial audits assures the reliability of this data. The Commission audits about 60 percent of the 134 jurisdictional natural gas pipelines every four years. We audit the other companies more or less frequently, depending on factors such as the use of automatic mechanisms and the frequency of rate filings.

The audits also assist the Commission in such diverse areas as:

- evaluating the overall health of the natural gas industry;
- determining the financial performance of specific companies;
- determining potential or actual discrimination by jurisdictional companies in price and quality of service;
- performing edit checks to assess the accuracy of information posted on electronic bulletin boards mandated by the Commission and operated by jurisdictional gas pipeline companies;
- reviewing information needed to monitor incentive rates and rate subsidies;
- testing for discriminatory transactions between jurisdictional companies and their affiliates; and
- ensuring that pipelines comply with the terms and conditions of their approved tariffs and certificate requirements.

As part of the ongoing effort to streamline regulation of the industries, we have issued a final rule revising Forms 2 and 2-A and Form 11 filing requirements for interstate natural gas pipelines. In FY 1997 we will be completing the implementation of the new data filing requirements and associated changes to the electronic filing requirements for these forms.

Similarly, we administer a Uniform System of Accounts and Form 6 reporting requirements for jurisdictional oil pipelines. We have issued final rules that deleted, modified or added new Form 6 reporting requirements and established a minimum filing threshold for Form 6. We audit the books and records of the Trans Alaska Pipeline System and its owners on a cyclical basis; we audit all other oil pipelines on an as-needed basis.

Summary of Natural Gas and Oil Pipelines Workload and Resource Needs

Order No. 636 ushered in a newly competitive era for natural gas sales and has freed the industry to develop a robust array of new services and financial instruments. The new dynamic has led to many significant new challenges in the regulatory arena. Most interstate pipelines will continue to be regulated monopolies. The Commission faces the challenge of how to improve its approach to regulation in the new environment. We retain important responsibilities and will continue to play a significant role as the industry responds and adjusts to the changes brought about by Order No. 636, and as we address new issues that continue to arise.

Natural Gas. As participants adapt to the restructured natural gas industry, we expect to encounter new and difficult issues. Issues that were not prominent prior to implementation of Order No. 636 — such as market-based rates and incentive rates, the secondary market, market hub development, and decontracting in some markets — now confront the Commission. We must develop approaches and policies for addressing these issues. Furthermore, existing concerns such as production area rates must be addressed.

Overall, the number of certificate filings in FY 1996 and FY 1997 is expected to be constant. However, an increasing portion of that workload will be comprised of the more complex workload including new pipeline construction projects, particularly several in the northeast and midwest, plus new storage projects, unique service proposals, and conversion of oil pipelines to gas pipelines. Abandonment filings are expected to decline slightly, as are prior notice filings, as the Order No. 636 transition period ends. Partially offsetting the decline in these workload categories will be increases in compliance activities relating to the annual reports on facility construction under blanket certificates. Further, nonenvironmental certificate activity is expected to increase.

Ratemaking workload, while decreasing in quantity, is increasing in difficulty and complexity. Regulation in today's lightened regulatory environment is no less difficult, and in many cases no less time consuming, since new issues presented have no precedents upon which the Commission can rely.

Increased electronic filing of materials in the gas program is expected to improve the overall productivity of the program through simultaneous use of materials filed, faster access to materials, and the elimination of manual extraction and entering of data.

Oil Pipelines. In FY 1997, we will be in the third full year of the revised regulatory scheme applicable to oil pipelines. The Energy Policy Act required that we streamline our ratemaking methodology and simplify our filing requirements. However, as we implement these measures, we expect some companies to file to increase their rates either selectively or across the board as allowed under the new rule. These filings are reflected in the general tariff and rate increase categories, respectively. We anticipate that the workload growth in these categories will lead to more litigated cases as these filings present issues to be resolved in formal hearings.

SUMMARY NATURAL GAS AND OIL PIPELINES WORKLOAD

Receipts

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Certificates	2,827	2,548	2,473
Rates	6,251	2,386[5]	2,239
Oil Pipelines	1,731	1,711	1,704
TOTAL	10,809	6,645	6,416

Completions

	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Certificates	2,812	2,503	2,369
Rates	6,281	2,378	2,142
Oil Pipelines	1,666	1,789	1,770
TOTAL	10,759	6,670	6,281

Year-End Pending

	FY 1994 Actual	FY 1995 Actual	FY 1996 Estimate	FY 1997 Estimate
Certificates	541	556	601	705
Rates	706	676	684	781
Oil Pipelines	346	411	333	267
TOTAL	1,593	1,643	1,618	1,753

[5]This large decrease reflects the termination of the ministerial filing of the transportation transactions, which required less than three FTEs to maintain.

APPENDIX A:

WORKLOAD TABLES

ELECTRIC POWER WORKLOAD[6]

The following table includes receipts and completions in FY 1994 to provide a fuller picture of the growing substantive workload in electric power.[7]

	FY 1994 Actual			FY 1995 Actual			FY1996 Estimate			FY1997 Estimate		
Electric Power	R	C	P	R	C	P	R	C	P	R	C	P

APPENDIX C:

PERFORMANCE MEASUREMENTS

Performance Measurements

Our FY 1997 performance measurements reflect our goal to continue improving our regulatory models.

Making regulation work better and integrating market forces, where possible, into an overall regulatory model. We have begun the process, in several pending rulemakings, of developing new and better ways to analyze unique and complex problems, to reach fully justified decisions more quickly, and to cut the cost of doing regulatory business. This means improving and streamlining the regulations, specifying the types of information to be filed by the regulated companies and the methods (electronic versus paper) used in making those filings.

While the use of more traditional models of regulation will continue to be necessary in noncompetitive sectors of the industries, we have encouraged the growth of competition in such sectors as natural gas producing markets, oil pipelines, and electric power generation. For example, we are using an indexing model in oil pipeline rates and allowing some market-based pricing for oil pipelines where lack of market power is shown. In natural gas we have approved market-based rates for certain natural gas storage projects. This process will continue and evolve in the foreseeable future. We are also moving forward on this issue in the electric industry with the advent of the restructuring process in the electric transmission segment of the industry.

To protect customers through fostering efficiency, innovation and competition, we will:

- provide refined standards for market-based rates that encourage companies to identify competitive services and to apply for and receive market-based regulation;
- develop options for performance-based regulation for areas that cannot be competitive;
- provide rate certainty by deciding rate treatment in certificate cases for new natural gas pipeline construction; and
- establish fully comparable open-access transmission for all transmission owners under our jurisdiction.

Improving the efficiency of our environmental programs. In regulating hydropower development and natural gas pipeline construction, we will continue to balance all legitimate interests under many separate statutes, resolve questions quickly, and monitor future performance to ensure that the terms under which the utilities are allowed to build and operate balance environmental protection and project benefits.

To protect the environment and enhance project benefits, we will:

- reduce legitimate complaints that people have been excluded from environmental processes;

- reduce processing time for environmental reviews;
- increase the rate of voluntary compliance; and
- increase the percentage of dams meeting all current safety guidelines.

APPENDIX D:

STATUTORY AUTHORITY

2846

BOSTON PUBLIC LIBRARY
3 9999 05571 172 3

STATUTORY AUTHORIZATION

The Commission's primary sources of authority are the following statutes: Federal Power Act, Natural Gas Act, Department of Energy Organization Act, Energy Policy Act, Natural Gas Policy Act, Interstate Commerce Act, National Environmental Policy Act, Endangered Species Act, Electric Consumers Protection Act, Energy Security Act, Public Utility Regulatory Policies Act, Public Utility Holding Company Act, Pacific Northwest Electric Power Planning and Conservation Act, Regulatory Fairness Act, and Clean Air Act.

These statutes authorize the Commission to regulate:

- interstate sales for resale and transmission of electric energy;
- certification of exempt wholesale generators and qualifying facilities;
- corporate transactions, mergers, and security issues of electric public utilities;
- construction and operation of natural gas pipelines;
- interstate sales for resale and transportation of natural gas;
- interstate transportation of crude oil and petroleum products by pipeline; and
- construction, operation, and safety of non-Federal hydropower projects.
